DISTRICT SURVEY REPORT

FOR

"SAND MINING OR RIVER-BED MINING"

IN

JAMTARA DISTRICT OF JHARKHAND

As per Gazette Notification No. - S.O. - 3611 (E), 25th July 2018 by MoEF & CC & Enforcement & Monitoring Guidelines for Sand Mining 2020 by MoEF & CC

Approved

PREPARED BY:

TABLE OF CONTENT

Chapter No.	Description	Page No.
A	Index	2-8
B	Certificate	9-9
C	Recommendation by Sub-Divisional Committee & D.C.	10-10
1	Preface	11-15
2	Introduction	16-23
	2.1 Statutory framework	17-19
	2.2 Methodology & Chronology of DSR Preparation	19-23
3	General Profile of the District	24-37
	3.1 General Information	24-26
	3.2 Climatic Condition	26-27
	3.3 Rainfall & Humidity	27-28
	3.4 Topography & Terrain	28-28
	3.5 Water Course & Hydrology	29-32
	3.6 Status of Ground Water Development	32-33
	3.7 Drainage System	33-34
	3.8 Demography	35-36
	3.9 Connectivity – Jamtara District	36-37
4	Physiography of the District	38-40
	4.1 General Landforms	38-38
	4.2 Soil	39-39
	4.3 Geomorphology	39-40
5	Land Utilization Pattern of the District	41-45
	5.1 Forest	43-44
	5.2 Agriculture & Irrigation	44-45
6	Geology & Mineral Wealth	46-48
	6.1 Geology	46-47
	6.2 Overview of Mineral Resources	47-48
7	Overview of Mining Activity in the District	49-49
	7.1 List of Mining Lease in the District with location, area and period of validity	49-49
8	Details of Royalty or Revenue received in last three years	50-50
9	Details of Production of Sand or Bajri or minor mineral in last three years	51-51
10	Demand and Supply of the Mineral in the District	52-52
11	Process of Deposition of Sediments in the rivers of the District	53-61
	11.1 Classifying Rivers - Three Stages of River Development	53-54
	11.2 Stream Erosion and Deposition	54-57
	11.3 Flood Plain	57-58
	11.4 Replenishment of Sand	58-58

	11.5 Surface Runoff	58-61
12	Additional Information	**62-77**
	12.1 Drainage system with description of main River	62-62
	12.2 Salient features of Important Rivers and Streams	62-62
	12.3 Replenishment Study of Sand Deposit Zones (Category 2)	63-64
	12.4 Jharkhand State Sand Mining Policy 2017	65-66
	12.5 Details of 'Category 1' Sand Ghats	67-68
	12.6 Details of 'Category 2' Sand Ghats	68-73
	12.7 Details of Sand Deposit Zones	73-73
	12.8 Distance from Bridges & NH/SH for each Sand Ghat	74-74
	12.9 Replenishment Study of Sand Deposits (Category 2) [Verified & Approved]	75-76
	12.10 Photographs showing Sand Ghats Visit by Sub-Divisional Committee, Jamtara	77-77
13	Details of Eco-Sensitive Area in the District	**78-78**
14	Impact on the environment due to mining	**79-81**
	14.1 For Sand Mining	79-81
15	Remedial measures to mitigate the impact of mining on the environment	**82-88**
	15.1 Remedial Measures for Sand Mining	82-87
	15.2 Remedial Measures for other than Sand Mining	87-88
16	Risk Assessment & Disaster Management Plan	**89-87**
	16.1 Risk Assessment for Sand Mining	89-91
	16.2 Disaster Management Plan	91-91
	16.3 Vulnerability of the State	91-92
	References	92-92

CERTIFICATE

The District Survey Report (DSR) for Sand Mining or River-bed Mining in Jamtara District of Jharkhand State has been prepared by Sathi Planners Private Limited a QCI (NABET) accredited consultancy firm (Certificate No.: NABET/EIA/2225/RA0264).

District Survey Report Sand Mining or River-bed Mining in Jamtara District is prepared under;

✓ MoEF & CC, GoI Gazette Notification No. - S.O. 141 (E) dated 15/01/2016

✓ Sustainable Sand Mining Management Guidelines, 2016

✓ Sand Mining Policy of Government of Jharkhand, 2017

✓ MoEF & CC, GoI Gazette Notification No. - S.O. 3611 (E) dated 25/07/2018

✓ Enforcement and Monitoring Guidelines for Sand Mining, 2020

✓ Jharkhand Minor Mineral Concession Rule, 2021

The information mentioned in the District Survey Report for Sand Mining or River-bed Mining in Jamtara District of Jharkhand State are correct to the best of our knowledge.

1. PREFACE

MoEF & CC has published Notification No. - 3611 (E), dated 25th July 2018 regarding inclusion of the "Minerals Other than Sand" and format for preparation of the District Survey Report (DSR) for Sand mining or River-bed mining has been specified. Enforcement & Monitoring Guidelines for Sand Mining (EMGSM) January 2020, issued by Ministry of Environment, Forest and Climate Change is prepared in consideration of various orders/directions issued by Hon'ble NGT in matters pertaining to illegal sand mining and also based on the reports submitted by expert committees and investigation teams. This DSR has been prepared in conformity with the S.O. - 3611 (E) and other Sand mining guidelines published by MoEF & CC time to time as well as the requirement specified in Jharkhand State Sand Mining Policy 2017.

The purpose of DSR is to identify the mineral potential areas where mining can be allowed; and also to distinguish areas where mining will not be allowed due to proximity to infrastructural structures and installations, areas of erosion. The DSR would also help to estimate the annual rate of replenishment wherever applicable.

Field data collection is an integral part of DSR prepration. This report has been preparaed with the holistic approach and data provided by District Mining Office and study of Satellite imageries. The field data collection will be carried out post-monsoon season and a DSR with all updated data has been prepared.

Jamtara is new district created by separating from Dumka district. It is bounded by Deoghar district in north, Dumka and West Bengal in the east, Dhanbad and West Bengal in the south and Giridih in the west. It has an area of 1811 km² and population of 7,91,042 persons (Census of India, 2011). The district comprises one subdivision (Jamtara) and six development blocks viz. Kundhit, Nala, Jamtara, Narayanpur, Karmatanr and Fatehpur.

The district is located at a lower altitude of Chhotanagpur plateau and its latitude and longitude vary from 24° 08' N, 87° 01' E - 23°48' N, 86°53' E (North – South) to 24° 02'N, 86°28'E - 23°55' N, 87°17'E (East - West) respectively. The district lies in Survey of India Toposheets Nos. - 72 L/12, 72L/16, 72 P/4, 73 I/9, 73 I/13, 73M/1.

The history of Jamtara district is inseparable from the history of parent district of Santhal Pargana. Santhal Pargana was created as a separate district in the year 1855 by transferring out portions of Bhagalpur and Birbhum districts. The entire area comprising present divisions of Santhal Pargana, Hazaribag, Munger and Bhagalpur was termed as Jungleterry (Jungle Terai) by the English on assumption of Diwani in 1765.

Jamtara ranks 19th in terms of population (7,91,042) and 21st in terms of area (1811 km²) in the State of Jharkhand.

The economy of the district mainly depends on cultivation or related work. More than 64% of the total workers are engaged in Primary sector.

Sudrakshipur (Kundhit Block) has the largest area (1109.69 Hectare) and Sarodabarchak (Karmatanr Vidyasagar Block) has the smallest area (1.56 Hectare) among the villages in the district.

The district is mainly drained by the rivers Barakar, Rajiya Joriya, Ajay, Sheela (Shideshwari), Kurli, Hingli Brahmani, Mayurakshi and their tributaries.

The occurrence of River-bed Sand and Gravel in the district has been established by Department of Mines and Geology, Government of Jharkhand and others in previous instances. It requires further systematic and scientific approach to quantify the resource along with their grade assessment. Sand mining is mainly practiced in Ajay, Barakar, Hingla, Kuruli, Shiddheshwari Rivers of Jamtara district. This report also recommends to undertake detail exploration program

Approved

to assess the mineral occurrences in the major Rivers of the district and should have a proper development and production plan for the specified minerals.

Compliance of Enforcement & Monitoring Guidelines for Sand Mining, January 2020 by MoEF & CC":

Clause No.	Particulars	Status/Compliance
a	District Survey Report for Sand mining shall be prepared before the auction/e-auction/grant of the mining lease/Letter of Intent (LoI) by Mining Department or Department dealing the mining activity in respective States.	Noted.
b	In order to make the inventory of River-bed material, a detailed survey of the district needs to be carried out, to identify the source of River-bed material and alternative source of Sand (M-Sand). The source will include Rivers, de-siltation of reservoir/dams, Patta Land/Khatedari Land, M-Sand etc.	Complied with and explained in filled Annexure I, II & V of EMGSM 2020.
c	District Survey Report is to be prepared in such a way that it not only identifies the mineral-bearing area but also define the mining and no mining zones considering various environmental and social factors.	Complied while making the Sand Ghats.
d	Identification of the source of Sand & M-Sand. The sources may be from Rivers, Lakes, Ponds, Dams, De-silting locations, Patta land/Khatedari land. The details in case of Rivers such as [name, length of River, type (Perennial or Non-Perennial), Villages, Tehsil, District], in case of Lakes, Ponds, Dams, De-silting locations [Name, owned/maintained by (State Govt./PSU), area, Villages, Tehsil, District] in case of Patta land/Khatedari land [Owner Name, Sy. No., Area, Agricultural/Non-Agricultural, Villages, Tehsil, District], in case of M-Sand Plant [Owner Name, Sy. No., Area, Quantity/Annum, Villages, Tehsil, District], needs to be recorded .	No M-Sand source are available in the district. All the required details of Rivers are mentioned in desired format in Chapter 12 and filled Annexure I, II & V of EMGSM 2020.
e	Defining the sources of Sand/M-Sand in the district is the next step for identification of the potential area of deposition/aggradation wherein mining lease could be granted. Detailed survey needs to be carried out for quantification of minerals. The purpose of mining in the river bed is for channelization of rivers so as to avoid the possibility of flooding and to maintain the flow of the	Detailed Survey for capturing OGL has been done using UAV Drone/DGPS. Area of deposition has been identified accordingly. All Sand Ghats boundaries has been fixed after leaving the 1/4th of the River width for bank's safety. Tonnage factor of Sand has been calculated by analyzing

	Rivers. For this, the entire River stretch needs to be surveyed and original ground level (OGL) to be recorded and area of aggradation/deposition needs to be ascertained by comparing the level difference between the outside River-bed OGL and water level. Once the area of aggradation/deposition are identified, then the quantity of River-bed material available needs to be calculated. The next step is channelization of the River-bed and for this central 3/4th part of the River, width needs to be identified on a map. Out of the 3/4th part area, where there is a deposition/aggradation of the material needs to be identified. The remaining 1/4th area needs to be kept as no mining zone for the protection of banks. The specific gravity of the material also needs to be ascertained by analyzing the sample from a NABL accredited lab. Thus, the quantity of material available in metric ton needs to be calculated for mining and no mining zone.	Sand samples from NABL accredited Laboratory.
f	The permanent boundary pillars need to be erected after identification of an area of aggradation and deposition outside the bank of the river at a safe location for future surveying. The distance between boundary pillars on each side of the bank shall not be more than 100 meters.	Boundary pillars will be fixed while fixation of the mining lease boundary subsequent to District level verification.
g	Identifying the mining and no mining zone shall follow with defining the area of sensitivity by ascertaining the distance of the mining area from the protected area, forest, bridges, important structures, habitation etc. and based on the sensitivity, the area needs to be defined in sensitive and non-sensitive area.	No mining zone has been identified by measuring distance from bridges and permanent structures. Also, NOC from the concerned DFO & CO has been obtained for the potential area as per statutory norms. Enclosed as Annexures.
h	Demand and supply of the River-bed material through market survey needs to be carried out. In addition to this, future demand for the next 5 years also needs to be considered.	Complied.
i	It is suggested that as far as possible the sensitive areas should be avoided for mining, unless local safety condition arises. Such deviation shall be temporary & shall not be a permanent feature.	Agreed.
j	The final area selected for the mining should be then divided into mining lease as per the requirement of State Government. It is	Entire deposit area has been marked on map as Zones instead of small parts. Sand Ghat has

	suggested the mining lease area should be so selected as to cover the entire deposition area. Dividing a large area of deposition/aggradation into smaller mining leases should be avoided as it leads to loss of mineral and indirectly promote illegal mining.	been so prepared after leaving statutory distance & covering the entire deposit area within zone.
k	Cluster situation shall be examined. A cluster is formed when one mining lease of homogenous mineral is within 500 meters of the other mining lease. In order to reduce the cluster formation mining lease size should be defined in such a way that distance between any two clusters preferably should not be less than 2.5 km. Mining lease should be defined in such a way that the total area of the mining leases in a cluster should not be more than 10 Ha.	Since, the Sand deposit area has been divided into zones, formation of contiguous cluster has been consummated. Zone boundaries are fixed in such a way that it discontinues wherever there is bridge or no Sand deposition or confluence. Also, individual Sand Ghat area has been kept as large as possible in order to consummate the formation of cluster through artificial break of large area.
l	The number of a contiguous cluster needs to be ascertained. Contiguous cluster is formed when one cluster is at a distance of 2.5 km from the other cluster.	Due to formation of Sand deposit zone, no contiguous cluster has been formed.
m	The mining outside the River-bed on Patta land/Khatedari land be granted when there is possibility of replenishment of material. In case, there is no replenishment then mining lease shall only be granted when there is no River-bed mining possibility within 5 KM of the Patta land/Khatedari land. For Government projects, mining could be allowed on Patta land/Khatedari land but the mining should only be done by the Government agency and material should not be used for sale in the open market. Cluster situation as mentioned in para k above is also applicable for the mining in Patta land/Khatedari land.	Sand deposit area has been identified within River-bed only with proof of replenishment. No Patta/Khatedari land has been proposed for mining.
n	The State Government should define the transportation route from the mining lease considering the maximum production from the mines as at this stage the size of mining leases, their location, the quantity of mineral that can be mined safely etc. is available with the State Government. It is suggested that the transportation route should be selected in such a way that the movement of trucks/tippers/tractors from the villages having habitation should be avoided. The transportation route so	Transportation Route Map has been prepared for each Sand Ghat considering these factors and duly approved by competent authority. Attached as Map No. – D1 to D29.

	selected should be verified by the State Government for its carrying capacity.	
o	Potential site for mining having its impact on the forest, protected area, habitation, bridges etc., shall be avoided. For this, a Sub-Divisional Committee may be formed which after the site visit shall decide its suitability for mining.	Sub-Divisional Committee has been visited tha Sand Ghats and recommended the same. (Photographs with details are enclosed)
p	Public consultation - The Comments of the various stakeholders may be sought on the list of mining lease to be auctioned. The State Government shall give an advertisement in the local and national newspaper for seeking comments of the general public on the list of mining lease included in the DSR. The DSR should be placed in the public domain for at least one month from the date of publication of the advertisement for obtaining comments of the general public. The comments so received shall be placed before the sub-divisional committee for active consideration. The final list of Sand mining areas [leases to be granted on River-bed & Patta land/Khatedari land, de-siltation location (ponds/lakes/dams), M-Sand Plants (alternate source of Sand)] after the public hearing needs to be defined in the final DSR.	The DSR has been kept in public domain for one month after publication of advertisement in local newspapers. Attached as Annexure.
q	The LOI should not be granted for mining area falling on both Rive-rbed and outside River-bed. Therefore, in the same lease, both types of area should not be included.	Shall be considered while issuing the LoI.

2. INTRODUCTION

The District Survey Report of Jamtara district has been prepared as per the guidelines of Ministry of Environment Forest & Climate Change (MoEF & CC), Government of India vide Notification S.O. - 1533(E) dated 14th Sept. 2006 and subsequent MoEF & CC issued Gazette Notification regarding Enforcement and Monitoring Guidelines for Sand Mining in January 2020. This report shall guide systematic and scientific utilization of natural resources, so that present and future generation may be benefitted at large. Prior to this, MoEF & CC had published Gazette Notification No. - S.O. 3611(E), dated 25th July 2018 and recommended the format for District Survey Report of Sand mining or River-bed mining.

The main objective of DSR is identification of areas of aggradations or deposition where mining can be allowed; and identification of areas of erosion and proximity to infrastructural structures and installations where mining should be prohibited and calculation of annual rate of replenishment and allowing time for replenishment after mining in that area. The DSR would also help to calculate the annual rate of replenishment wherever applicable and allow time for replenishment.

The objectives of the District Survey Report are as following:

1. Identification and Quantification of Mineral Resource and its optimal utilization.
2. To regulate the Sand & Gravel Mining in the Country, identification of site specificend-use consumers and reduction in demand & supply gaps.
3. Use of information technology (IT) & latest scientific method of mining for surveillance of the Sand mining at each step.
4. District Survey Report shall enable Environmental Clearance for cluster of Sand & Gravel mining. It shall assist concern Department during post Environmental Clearance Monitoring.
5. To control the instance of illegal mining.
6. To control the flood in the area.
7. To maintain the livelihood of aquatic habitat.
8. To protect the incursion of ground water in the area. Limiting extraction of material in floodplains to an elevation above the water table generally disturbs more surface area than allowing extraction of material below the water table.
9. To keep accumulated data records viz. details of Mineral Resource, potential area, lease, approved mining plan, co-ordinates of a district at one place.
10. To maintain the records of revenue generation.
11. In-stream extraction of Gravel from below the water level of a stream generally causes more changes to the natural hydrologic processes than limiting extraction to a reference point above the water level.
12. In-stream extraction of gravel below the deepest part of the channel generally causes more changes to the natural hydrologic processes than limiting extraction to a reference point above the thalweg.
13. Excavating sand and gravel from a small straight channel with a narrow floodplain generally will have a greater impact on the natural hydrologic processes than excavations on a braided channel with a wide floodplain.
14. Extracting Sand and Gravel from a large River or stream will generally create less impact than extracting the same amount of material from a smaller River or stream.
15. A concise guideline can be framed considering the point discussed in the DSR for Sand and or minor mineral mining in the district.

The District Survey Report (DSR) is comprised of data published and endorsed by various Departments and websites about geology of the area, mineral resources, climate, topography, land form, forest, rivers, soil, agriculture, road, transportation, irrigation etc. Data on lease and mining activities in the district, revenue etc. are collected from District Mining Office.

State Level Environment Impact Assessment Authority * Approved * Jharkhand, Ranchi *

2.1 Statutory Framework:

The table below has mentioned the requirement of District survey report and its year wise modification;

Table 2.1: Requirement of District Survey Report & its year wise modification

Year	Particulars
1994	The Ministry of Environment, Forest & Climate Change (MoEF & CC) published Environmental Impact Assessment Notification 1994 which is only applicable for the Major minerals more than 5 Ha.
2006	In order to cover the Minor minerals also into the preview of EIA, the MoEF & CC issued EIA Notification S.O. - 1533 (E), dated 14th September 2006, made mandatory to obtain environmental clearance for both Major & Minor mineral more than 5 Ha.
2012	Further, Hon'ble Supreme Court wide order dated the 27th February, 2012 in I.A. No. - 12- 13 of 2011 in Special Leave Petition (C) No. - 19628-19629 of 2009, in the matter of Deepak Kumar etc. Vs. State of Haryana and Others etc., ordered that "leases of minor minerals including their renewal for an area of less than five hectares be granted by the States/Union Territories only after getting environmental clearance from MoEF & CC"; and Hon'ble National Green Tribunal, order dated 13thJanuary, 2015 in the matter regarding Sand mining has directed for making a policy on environmental clearance for mining leases in cluster for Minor minerals.
2018	MoEF & CC published Gazette Notification No. - S.O. 3611(E) Dated 25th July, 2018 and recommended the format for District Survey Report. The notification stated about the objective of DSR, i.e. "Identification of areas of aggradations or deposition where mining can be allowed; and identification of areas of erosion and proximity to infrastructural structures and installations where mining should be prohibited and calculation of annual rate of replenishment and allowing time for replenishment after mining in that area".
2020	Enforcement & Monitoring Guidelines for Sand Mining (EMGSM 2020) has been published with modifying Sustainable Sand Mining Guidelines 2016 by MoEF & CC for effective enforcement of regulatory provisions and their monitoring. The EMGSM 2020 directed the States to carry out river audits, put detailed survey reports of all mining areas online and in the public domain, conduct replenishment studies of river beds, constantly monitor mining with drones, aerial surveys, ground surveys and set up dedicated task forces at district levels. The guidelines also push for online sales and purchase of sand and other riverbed materials to make the process transparent. They propose night surveillance of mining activity through night-vision drones.

➢ **Enforcement & Monitoring Guidelines for Sand Mining (EMGSM 2020) by MoEF & CC:**

The main objective of the guideline is to ensure sustainable Sand mining and environment friendly management practices in order to restore and maintain the ecology of River and other Sand sources.

a) Parts of the River reach that experience deposition or aggradations shall be identified first. The Lease holder/Environmental Clearance holder may be allowed to extract the Sand and Gravel deposit in these locations to manage aggradations problem.

State Level Environment Impact Assessment Authority
Approved

b) The distance between sites for Sand and Gravel mining shall depend on the replenishment rate of the River. Sediment rating curve for the potential sites shall be developed and checked against the extracted volumes of Sand and Gravel.
c) Sand and Gravel may be extracted across the entire active channel during the dry season.
d) Abandoned stream channels on terrace and inactive flood plains be preferred rather than active channels and their deltas and flood plains. Stream should not be diverted to form inactive channel.
e) Layers of Sand and Gravel which could be removed from the River-bed shall depend on the width of the River and replenishment rate of the River.
f) Sand and Gravel shall not be allowed to be extracted where erosion may occur, such as at the concave bank.
g) Segments of braided River system should be used preferably falling within the lateral migration area of the River regime that enhances the feasibility of sediment replenishment.
h) Sand and Gravel shall not be extracted up to a distance of 1 kilometre (1 km) from major bridges and highways on both sides, or five times (5x) of the span (x) of a bridge/public civil structure (including water intake points) on up-stream side and ten times (10x) the span of such bridge on down-stream side, subjected to a minimum of 250 meters on the upstream side and 500 meters on the downstream side.
i) The sediment sampling should include the bed material and bed material load before, during and after the extraction period. Develop a sediment rating curve at the upstream end of the potential reach using the surveyed cross-section. Using the historical or gauged flow rating curve, determine the suitable period of high flow that can replenish the extracted volume. Calculate the extraction volume based on the sediment rating curve and high flow period after determining the allowable mining depth.
j) Sand and Gravel could be extracted from the downstream of the sand bar at River bends. Retaining the upstream one to two-thirds of the bar and riparian vegetation is accepted as a method to promote channel stability.
k) The flood discharge capacity of the river could be maintained in areas where there is a significant flood hazard to existing structures or infrastructure. Sand and Gravel mining may be allowed to maintain the natural flow capacity based on surveyed cross-section history. Alternatively, off-channel or floodplain extraction is recommended to allow rivers to replenish the quantity taken out during mining.
l) The Piedmont Zone (Bhabhar area) particularly in the Himalayan foothills, where River-bed material is mined, this sandy-gravelly track constitutes excellent conduits and holds the greater potential for groundwater recharge. Mining in such areas should be preferred in locations selected away from the channel bank stretches.
m) Mining depth should be restricted to 3 meters and distance from the bank should be ¼th or river width and should not be less than 7.5 meters.
n) The borrow area should preferably be located on the riverside of the proposed embankment because they get silted in the course of time. For low embankment, less than 6m in height, borrow area should not be selected within 25 m from the toe/heel of the embankment. In the case of the higher embankment, the distance should not be less than 50m. In order to obviate the development of flow parallels to the embankment, crossbars of width eight times the depth of borrow pits spaced 50 to 60-meter center-to-center should be left in the borrow pits.
o) Demarcation of mining area with pillars and geo-referencing should be done prior to the start of mining.
p) A buffer distance/un-mined block of 50 meters after every block of 1000 meters over which mining is undertaken or at such distance as may be the directed/prescribed by the regulatory authority shall be maintained.
q) A buffer distance/unmined block of 50 meters after every block of 1000 meters over which mining is undertaken or at such distance as may be the directed/prescribed by the regulatory authority shall be maintained.

State Level Environment Impact Assessment Authority Jharkhand, Ranchi Approved

r) River-bed Sand mining shall be restricted within the central 3/4th width of the river/rivulet or 7.5 meters (inward) from river banks but up to 10% of the width of the River, as the case may be and decided by regulatory authority while granting environmental clearance in consultation with irrigation department. Regulating authority while regulating the zone of River bed mining shall ensure that the objective to minimize the effects of River bank erosion and consequential channel migration are achieved to the extent possible. In general, the area for removal of minerals shall not exceed 60% of the mine lease area, and any deviation or relaxation in this regard shall be adequately supported by the scientific report.

s) Mining Plan for the mining leases (non-government) on agricultural fields/Patta land shall only be approved if there is a possibility of replenishment of the mineral or when there is no riverbed mining possibility within 5 KM of the Patta land/Khatedari land. For government projects mining could be allowed on Patta land/Khatedari land but the mining should only be done by the Government agency and material should not be used for sale in the open market.

The minerals reserve for river bed area is calculated on the basis of maximum depth of 3 meters and margins, width and other dimensions as mentioned in para(s) above. The area multiplied by depth gives the volume and volume multiplied with bulk density gives the quantity in Metric Ton. In case of River-bed, mineable material per hectare area available for actual mining shall not exceed the maximum quantity of 60,000 MT per annum.

➢ The Ministry of Environment Forest & Climate Change formulated the Sustainable Sand Management Guidelines 2016 which focuses on the management of sand mining in the country. But in the recent past, it has been observed that apart from management and systematic mining practices there is an urgent need to have a guideline for effective enforcement of regulatory provision and their monitoring. Section 23 C of MMDR 1957 empowered the State Government to make rules for preventing illegal mining, transportation and storage of minerals. But in the recent past, it has been observed that there was large number of illegal mining cases in the Country and in some cases, many of the officers lost their lives while executing their duties for curbing illegal mining incidence. The illegal and uncontrolled illegal mining leads to loss of revenue to the State and degradation of the environment.

2.2 Methodology of DSR Preparation:

The data related to district profile, geology, mineralization, mining activity are sketchy and disjointed. There are multiple data sources, which are in the public domain, as well as in Government website. To prepare District Survey Report, need to collate all the available databases on these in this regard. A comprehensive and a meaningful interpretable database created, which would be necessary to demonstrate the district overview. Workflow for the DSR job is as follows.

Data Source Identification: District Survey Report has been prepared based on the Primary data base collected from different sources. The data sources which are used in DSR are mostly Government published data based on the published report in reputed journal. District profile has been prepared based on the District Census 2011. Mining lease details and the revenue generated from Minor minerals has been prepared based on available data from District Mining Office of the district. Satellite image has been used for map preparation related to physiography and land utilization pattern of the district.

State Level Environment Impact Assessment Authority * Jharkhand, Ranchi *
Approved

Data Analysis and Map Preparation: Dataset which are captured during the report preparation, are gone through detail analysis work. District Survey Report involves the analytical implication of captured dataset to prepare relevant maps. Methodology adopted for preparation of relevant maps is explained below.

Land Use and Land Cover Map: Land Use and Land Cover classification is a complex process and requires consideration of many factors. The major steps of image classification may include determination of a suitable classification system via Visual Image Interpretation, selection of training samples, Satellite image (FCC - False Colour Composition) pre-processing, selection of suitable classification approaches, post-classification processing, and accuracy assessment.

Here LISS-III Satellite Imagery has been taken for Supervised Classification as supervised classification can be much more accurate than unsupervised classification, but depends heavily on the training sites, the skill of the individual processing the image, and the spectral distinctness of the classes in broader scale.
According to the Visual Image Interpretation (Tone, Texture, Colour etc.) training set of the pixel has been taken.

Table 2.2: Pictorial Descriptions of Physiographic Classification

Agricultural Land - Based on their Geometrical shape, Red and Pink colour tone, Agricultural Land has been identified.	**Vegetation Covered Area** - Based on their continuous Red colour tone, Vegetation Covered Area has been identified.
	Agricultural Fallow Land - Based on their Geometrical shape, Light and dark Cyan with light Pink colour tone, Agricultural Land has been identified.	**Bad Land Topography**- Light Yellowish mixed with Cyan colour has been identified as Bad Land Topography.

State Level Environment Impact Assessment Authority * Jharkhand * Ranchi *
Approved

	Settlement – Area with Cyan colour including geometrical shape has been recognised as Settlement Area.	**Water Bodies** – Dark Blue colour has been classified as Water Bodies.

Geomorphological Map:

The major steps of preparing Geomorphological Map is identifying features like – Alluvial Fan, Alluvial Plain, Hilly Region etc. from Satellite Imagery (FCC - False Colour Composition) via Visual Image Interpretation and then digitization has been taken into the consideration to prepare map including all the Geomorphological features according to their location.

Physiographical Map:

The major step of preparing Physiographical Map is generating contour at a specific interval to show the elevation of the area using Cartosat DEM.

Block Map:

- Raw Data collected from **National Informatics Centre (NIC Website)** during March 2022 and October 2022.
- Data has been geo-referenced using GIS software.
- Digitization of Block boundary, District Boundary, State Boundary, International Boundary, and District Headquarter, sub–district Headquarter, Places, Road, Railway, River, Nala etc.
- Road name, River name, Railway name has been filled in attribute table of the Layers.
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Transportation Map:

- Raw Data collected from **National Informatics Centre (NIC Website)** during March 2022 and October 2022.
- Data has been geo-referenced using GIS software.
- Digitization of Block boundary, District Boundary, State Boundary, International Boundary, and District Headquarter, sub–district Headquarter, Places, Road, Railway, River, Nala etc. Road name, River name, Railway name has been filled in attribute table of the Layers.
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Drainage Map:

- Raw Data collected from **National Informatics Centre (NIC Website)** during March 2022 and October 2022.
- Data has been geo-referenced using GIS software.
- Digitization of Block boundary, District Boundary, State Boundary, International Boundary, and District Headquarter, sub–district Headquarter, Places, Road, Railway, River, Nala etc.
- Road name, River name, Railway name has been filled in attribute table of the Layers.

- Final layout has been prepared by giving scale, legend, north arrow, etc.

Earthquake Map:

- Raw data collected from **Ministry of Earth Science.**
- Data has been geo-referenced using GIS software.
- Digitization of Earthquake zone and superimposed it over Block Boundary.
- Zone name has been filled in attribute table of the Layers.
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Soil Map:

- Raw data collected from **National bureau of Soil Survey and Land Use Planning.**
- Data has been geo-referenced using GIS software.
- Digitization of Soil classification zone and superimposed it over District Boundary.
- Soil classification has been filled in attribute table of the Layers.
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Wildlife Sanctuary and National Park Location Map:

- Raw data collected from **ENVIS Centre on Wildlife & Protected Areas**
- Data has been geo-referenced using GIS software.
- Digitization of Wildlife Sanctuary& National park and superimposed it over Block Boundary.
- Wildlife Sanctuary & National park name has been filled in attribute table of the Layers.
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Primary Data Collection: Field data collection is an integral part of DSR. This report has been preparaed with the holistic approch and data provided by District Mining Office and study of Satellite imageries. The field data collection will be carried out post-monsoon season and a DSR with all updated data has been prepared.

Replenishment study: One of the principal causes of environmental impacts from in-stream mining is the removal of more sediment than the system can replenish. It is therefore need for replenishment study for River-bed Sand in order to nullify the adverse impacts arising due to excessing sand extraction. The annual rate of replenishment carried out on every River of the district to have proper assessment of the sand reserve for mining purposes.

Four times Physical survey is to be carried out by DGPS/Total Station to define the topography, contours and offsets of the River-bed. The surveys should clearly depict the important attributes of the stretch of the River and its nearby important civil and other feature of importance. This information will provide the eligible spatial area for mining. Primary data has been taken into use in subsequent phases.

Report Preparation: District Survey Report has been prepared to fulfill the purpose of identification of mining area both Major and Minor mineral and their impact on environment. Report provides details of the major and mineral potential zones. Assessing mining prospect with respect to minor minerals. Replenishment study details includes in the report. Report also provides the socio environmental study for establishing mining leases of Minor minerals in the district.

Demand and Utilization of Sand:
Sand is a multi-purpose construction material. It is known as one of the three fundamental ingredients in concrete. The composition of Sand is diverse. Mostly Sand is made of Silica which is a common element. It can also come from another source of minerals like Quartz, Limestone, or Gypsum.

State Level Environment Impact Assessment Authority
Approved
Jharkhand, Ranchi

From beds to flood plains to coastlines - we can find the Sand at almost everywhere. The robustness of Sand has played a significant role in everyday life. We use sand practically every other day.

Sand extraction from River-bed and brick earth mining for making raw bricks are the main mining activities in the district. With a spurt in construction of real estate sectors and various Govt. sponsored projects, the demand for both Sand and Bricks has increased manifold.

The extraction of Sand is carried out either manually or through semi-mechanized system. The depth of mining for both River-bed Sand and Brick earth is restricted due to statutory provision in the regulations pertaining to conservation and development of minor minerals.

River Sand mining is a common practice as habitation concentrates along the Rivers and the mining locations are preferred near the markets or along the transportation route, for reducing the transportation cost. In the real world, there are a lot of situations where we can find uses of Sand. Followings are the common sand uses -

1. While bunging metal, we can mix Sand with clay binder for frameworks used in the foundries.
2. Sand can be used for cleaning up oil leak or any spill by dredging Sand on that spill. The material will form clumps by soaking up, and we can quickly clean the mess.
3. Sand can be used as a road base which is a protective layer underneath all roads.
4. Industrial Sand is used to make glass, as foundry sand and as abrasive Sand.
5. One creative usage of Sand is serving as a candle holder. We can try putting some sand before pouring tea light or any candle in a glass. It holds the candle still and refrain the candle from rolling by giving it an excellent decoration.
6. Adds texture and aesthetic appeal to space.
7. Sand is mostly pure to handle, promptly available and economically wise.
8. We use sand in aquariums, fabricating artificial fringing reefs, and in human-made beaches.
9. Sandy soils are ideal for growing crops, fruits and vegetables like watermelon, peaches, peanuts.
10. Sand can light a path by filling mason jars with sand and tea light which is another in expensive way to make a walkway glow.
11. Sand helps to improve resistance (and thus traffic safety) in icy or snowy conditions.
12. We need Sand in the beaches where tides, storms or any form of preconceived changes to the shoreline crumble the first Sand.
13. Sand containing Silica is used for making glass in the automobile and food industry - even household products for the kitchen.
14. Sand is a strong strand which is used for plaster, mortar, concrete, and asphalt.
15. The usual bricks formulated of clay only is way weaker and lesser in weight than blocks made of Clay mixed with Sand.

- **Chronology:**

Sl. No.	Time Period	Activity
1	January 2022	Pre Monsoon study of Sand deposit has been carried out by the District Mining Office.
2	October 2022	Work for Preparation of DSR has been allotted to the concerned NABET accredited Consultants.
3	October 2022	Post-Monsoon survey as well as study of Satellite imageries has been conducted.
4	November 2022	Softcopy of Draft DSR has been uploaded to the NIC portal for review.
5	January 2023	Incorporating all the suggestions received and field verification by the Sub-Divisional Committee, DSR has been finalized.
6	May 2023	DSR has been placed in front of the Hon'ble SEAC Jharkhand for approval.

State Level Environment Impact Assessment Authority * Jharkhand, Ranchi * Approved

3. GENERAL PROFILE OF THE DISTRICT

3.1 General Information:

Jamtara is new district created by separating from Dumka district. It is bounded by Deoghar district in north, Dumka and West Bengal in the east, Dhanbad and West Bengal in the south and Giridih in the west. It has an area of 1811 km² and population of 7,91,042 persons (Census of India, 2011). The district comprises one subdivision (Jamtara) and six development blocks viz. Kundhit, Nala, Jamtara, Narayanpur, Karmatanr and Fatehpur.

The district is located at a lower altitude of Chhotanagpur plateau and its latitude and longitude vary from 24° 08' N, 87° 01' E - 23°48' N, 86°53' S (North–South) to 24° 02'N, 86°28'E - 23°55' N, 87°17'E (East–West) respectively. The district lies in Survey of India Toposheets Nos. - 72 L/12, 72L/16, 72 P/4, 73 I/9, 73 I/13, 73M/1.

The history of Jamtara district is inseparable from the history of parent district of Santhal Pargana. Santhal Pargana was created as a separate district in the year 1855 by transferring out portions of Bhagalpur and Birbhum districts. The entire area comprising present divisions of Santhal Pargana, Hazaribag, Munger and Bhagalpur was termed as Jungleterry (Jungle Terai) by the English on assumption of Diwani in 1765.

Jamtara ranks 19th in terms of population (7,91,042) and 21st in terms of area (1811 km²) in the State of Jharkhand.

The economy of the district mainly depends on cultivation or related work. More than 64% of the total workers are engaged in Primary sector.

Sudrakshipur (Kundhit Block) has the largest area (1109.69 Hectare) and Sarodabarchak (KarmaTanr Vidyasagar Block) has the smallest area (1.56 Hectare) among the villages in the district.

The district is mainly drained by the rivers Barakar, Rajiya Joriya, Ajay, Sheela (Shideshwari), Kurli, Hingli Brahmani, Mayurakshi and their tributaries.

EAST	Dumka & West Bengal
WEST	Giridih District
NORTH	Deoghar District
SOUTH	Dhanbad & West Bengal

Table 3.1: Administrative Set up of the Jamtara District

Jamtatra town is the Division headquarter of Jamtara itself. For administrative purpose the district has been divided into 1 sub-division and 06 nos. of Blocks/Tehsils as follows: -

Sub-Division & Blocks

- **Sub-Division:** 1 No.

1. Jamtara

- **Blocks/Tehsil:** 06 Nos.

1. Fatehpur
2. Jamtara
3. Karmatanr
4. Kundhit
5. Nala
6. Narayanpur

State Level Environment Impact Assessment Authority * Jharkhand, Ranchi * Approved

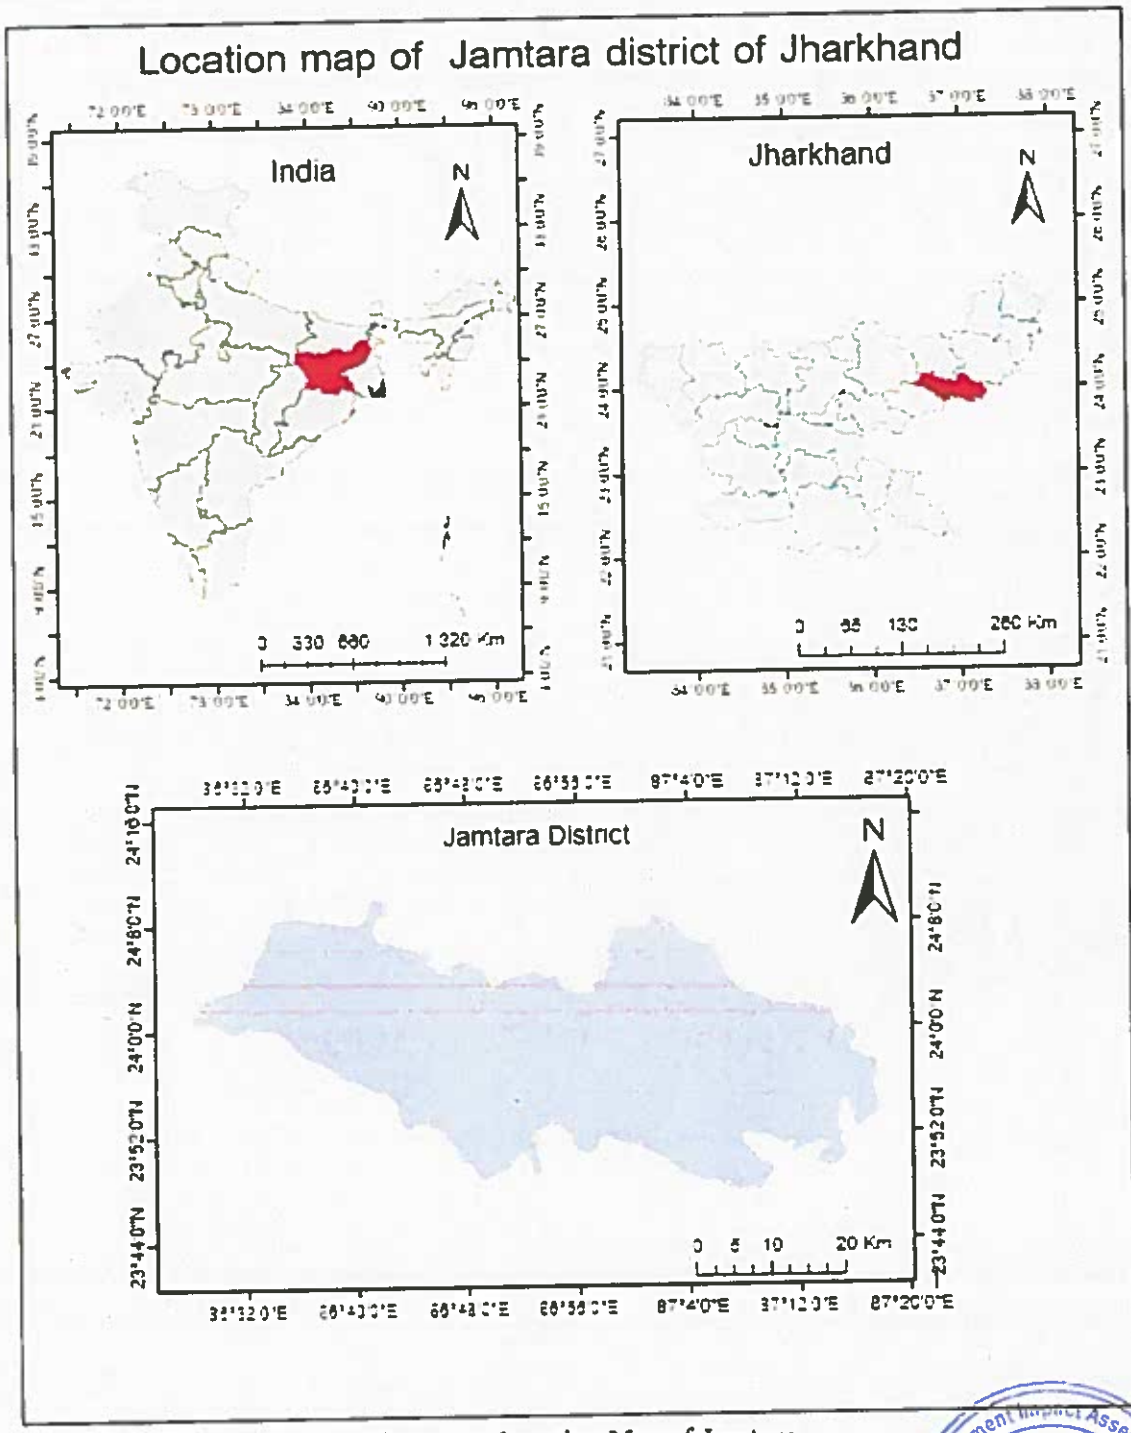

Figure 3.1: Location Map of Jamtara

State Level Environment Impact Assessment Authority
Approved
Jharkhand, Ranchi

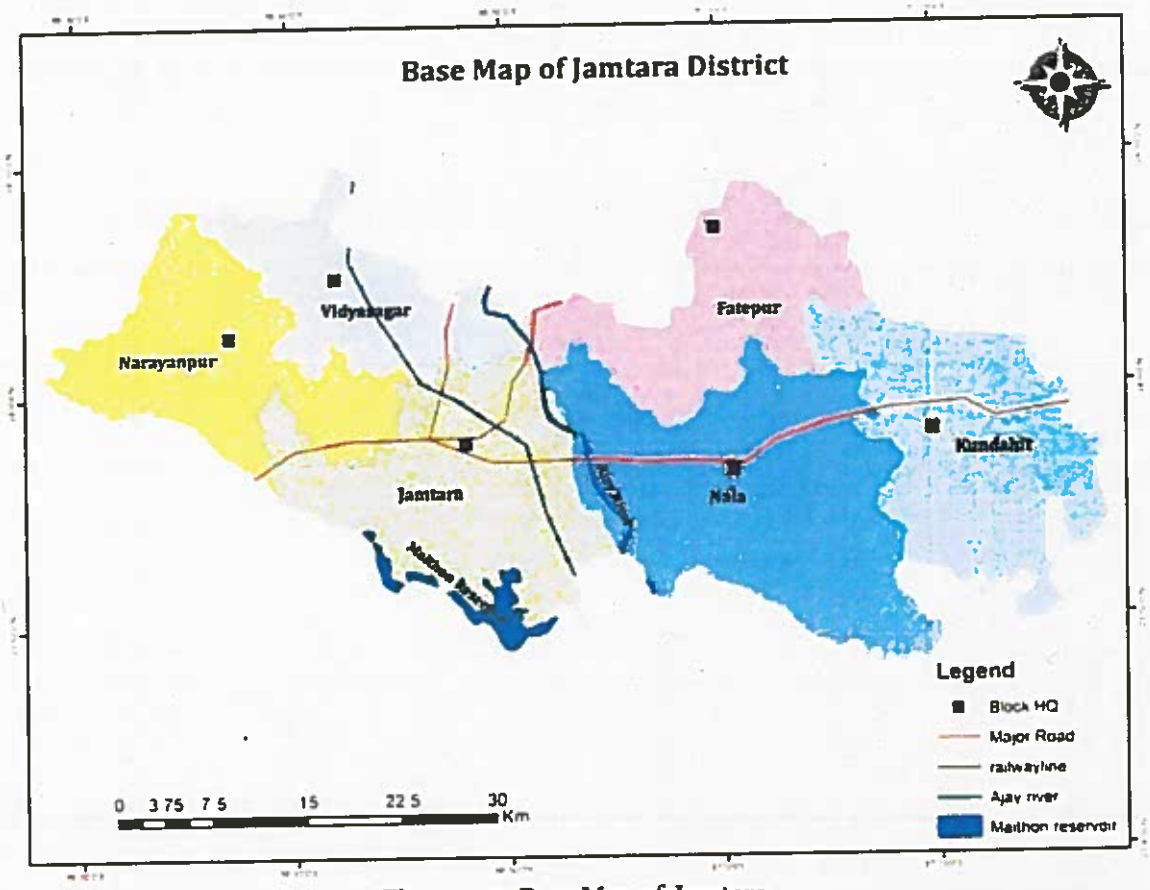

Figure 3.2: Base Map of Jamtara

(Source - Jamtara.nic.in)

3.2 Climatic Condition:

Owing to its position near West Bengal and hilly landscape of the region climatic condition is slightly different from the rest of the state. The district receives an annual rainfall of 1500 mm. and most of the rainfall occurs during the rainy season. During winter season the temperature varies between 10°C to 16°C and during summer season it varies between 22°C to 40°C.

(Source – jamtara.nic.in)

Temperature

The summer season starts from the month of March with warm and humid conditions and ends in June. The maximum highest temperature varies from 46°C in the month of May and June while minimum temperature varies from 4°C to 7°C during December and January. Table below mentions the temperature variation throughout the year -

Table 3.2: Monthly average temperature distribution of Jamtara District (in °C)

3.3 Rainfall & Humidity:

Owing to its position near West Bengal and hilly landscape of the region climatic condition is slightly different from the rest of the State. The district receives an annual rainfall of 1500 mm. and most of the rainfall occurs during the rainy season. During winter season the temperature varies between 10°C to 16°C and during summer season it varies between 22°C to 40°C.

Relative Humidity, Wind Speed & Wind Direction

The entire district experiences a high relative humidity that is spread uniformly. Generally, the humidity ranging from 61% to 81% during the monsoon and the relative humidity generally decreases in drier months of March and April are less humid with the relative humidity ranging between 25% - 35%.

The winds over the district are high during monsoon, the average wind speed in monsoon seasons varies from 7 mph to 9 mph, and occasionally the wind speed goes over the 18 mph due to depression and local storm. The wind direction in the monsoon season is South-West wind.

3.4 Topography & Terrain:

The area is characterized by undulating topography with hills and plain. The district is located in Rajmahal highland. It consists of rolling open land surface with long ridges and interveining depressions. The highest and lowest elevation identified in north western and south eastern part of the district. The area having a relief of above + 354 amsl constitutes scaterred hill features of pre-cambrian rocks. In central part of the district near ajay river basin, elevation range occurs between 97-156 above msl. Eastern zone of the district is mostly low land area whereas western part of the district is generally upland area. The digital elevation model of Jamtara district has been prepared and shown in figure.

3.5 Water Courses and Hydrogeology:

The district is underlain by the Precambrian crystalline metamorphic rocks, intrusive, Gondwana sedimentaries and recent to sub-recent alluvium occurring as thin and discontinuous patches on a limited scale along prominent drainage channels.

The hard crystallines of the Precambrian age occupy 90% of the total geographical area of the district. The semi-consolidated rocks of the Gondwana formation occur in pockets. The Pre-cambrians are hard and compact and do not possess primary porosity, though secondary porosity is produced in these rocks due to weathering, jointing, fracturing etc. Ground water occurrence and movement in these rocks are manifested through the secondary porosity and permeability introduced in them due to their weathering and fracturing.

Ground water occurs under unconfined conditions in the weathered mantle and under semi-confined to confined conditions in the fractured rocks below.

The major hydrogeological units in the district can be subdivided into two broad groups.
i) Areas underlain by fractured, fissured and consolidated formations
ii) Areas underlain by the semi-consolidated (Gondwana) formation.

Consolidated Formation

Granites and Gneisses are the most predominant rock types among all other rocks falling under the consolidated unit. Weathering in granitic rocks is pronounced and fissures and joints etc. are also well developed. These rocks are traversed by numerous veins of quartz and pegmatite. Weathered zones of granites and gneisses are the most productive zone for ground water development. The depth of weathering varies from place to place, which influences the aquifer characteristics. The drinking water and sanitation department has drilled a number of tube wells in Jamtara district having a yield of approximately 80 liters per minute. The dug wells in this formation have a depth to water range from 4 m to 9 m bgl and the wells can sustain 2 hours of pumping with a yield range of 4000 to 8000 liters per hour. These aquifers are mainly unconfined to semi-confined in nature. Dug wells within the hard, fractured granites cannot sustain long durations of pumping. Fracture porosity plays an important role but with varying degree, in different parts of the area depending upon the pattern and intensity of joints and fractures. The potentiality and yielding property of these aquifers vary considerably. Bore wells can be constructed tapping the deep-seated fractures and joints.

Semi-Consolidated Formation

The areas underlain by the semi-consolidated (Gondwana) formation occur in isolated pockets in the northern part of the district. The rocks are mainly sandstones and shales belonging to the Barakar and Talchir formation. Barakar sandstones are coarse to medium grained, weathered in nature and may be a productive zone for ground water development. Exploration work has to be taken up for knowing detail aquifer characteristics of Gondwana formation. The yield of wells in this formation is less than 10 m^3/hr. Wells constructed in sandstone yield better than those in shale. Depth of open wells in this formation ranges from 5 to 12 m bgl. Dug wells can sustain pumping of 1 m^3 of water per hour with a moderate recuperation rate.

Depth toWater level

During May 2012, the depth to water levels in HNS wells tapping shallow aquifer ranged from 6.70 to 11.80m bgl. Depth to ground water levels during the post monsoon (November 2012) varied between 3.31 and 5.93 m bgl. Categorization of depth to water level of pre-monsoon period (May 2012) for HNS in Jamtara district is presented below in table below: -

Aquifer Parameters

A total of 02 exploratory wells and 01 observations well have been drilled down to depth of 198.46 m in hard rock formation to decipher the potential fracture zones. The exploratory data reveals presence of maximum of 6 sets of potential fractures between 12m and 136 m depth. The yield of the wells has been found between 0.9 and 26.1 m^3/hr. The summarized hydrogeolgical data of exploratory wells has been presented in table below -

Table 3.6: Summarized hydrogeological data of exploratory drilling in Jamtara District

Rock Type	No. of fractures tapped	Depth zone within which fractures confined	Water level (m bgl)	Yield (m^3/hr.)
Granite gneiss	1-6	12-135.58	6.89-8.16	0.9-26.1

Ground Water Quality

Ground water in the phreatic aquifers in Jamtara district has been found to be colourless, odourless and slightly alkaline in nature. The specific electrical conductance of ground water in phreatic zone during May 2011 was 200 µS/cm at 25°C. The suitability of ground water for drinking purpose has been evaluated on the basis of pH, Total hardness (T.H), Ca, Cl, F and NO_3. The chemical concentration of these constituents, when compared with the drinking water specification recommended by IS: 10500, 1991 as presented in table, indicates that none of the samples exceed the permissible limit set for drinking use.

Table 3.7: Number of samples exceeding permissible limit in the district

Quality	IS:10500, 1991		No. of samples in the district exceeding permissible limit
	Desirable limit	Permissible limit	
pH	7.42	No relaxation	0
T.H	75	600	0
Ca	16	200	0
Cl	18	1000	0
F	-	1.5	0
NO_3	-	100	0

3.6 Status of Ground Water Development

In the rural areas the entire water supply is dependent on ground water. Ground water development is mainly carried out in the district through dug wells and Hand pumps. Dug wells are in general of 2 m diameter and between 8 to 15 m depth, depending on the thickness of the weathered zone, tapping the shallow ground water in the weathered zone and uppermost slice of the basement. Large number of dug wells used for drinking water is under private ownership for which there is no reliable data. Over the years Mark II/Mark III hand pumps are being drilled in large numbers for ground water development. These hand pumps have the following two major

State Level Environment Impact Assessment Authority * Jharkhand, Ranchi *
Approved

advantages -

i) are less susceptible to contamination from surface sources and
ii) they tap fractures between 20-60m depth which have been found to be less affected by seasonal water level fluctuation and thus have lesser chances of failure even during extreme summer. In rural areas of Jamtara district the number of hand pumps drilled by PHED is 9561 of which 6815 are under working condition.

In the urban areas ground water plays a supplementary role in water supply, the major supply being made through dams, reservoirs or weirs across rivers or streams. No authentic data is available on the number of ground water structures catering the urban water supply. For Jamtara urban area, the dependence on ground water has been considered as 15%.

As per the latest resource estimation carried out following GEC 97 methodology, the overall stage of ground water development in Jamtara district is 22.94% indicating sufficient scope of development.

3.7 Drainage System:

The district is mainly drained by the rivers Barakar, Rajiya Joriya, Ajay, Sheela (Shidheshwari), Kurli, Hingli Brahmani, Mayurakshi and their tributaries. The drainage is mainly controlled by South easterly flowing Ajay River and Southerly flowing Barakar River and their tributaries. The drainage pattern is mostly dendritic and drainage density is moderate. Ajay and Barakar rivers are the highest order stream in the area. The drainage of the area is controlled by these two rivers and their tributaries. Ajay River flows from North-West to South-East, while Barakar River flows from North to South. Ajay River originates from Saran (24°29'00" N; 86°18'00" E) in the south eastern part of Chakai Plateau and flows eastward into Bhagirathi catchments. It enters the district area with a large meandering loop and then follows the straight course and exits near Debkunda in a meandering fashion. Barakar is also a long-distance river, originating at the Koderma plateau, and occupies the south-western part of the district. Maithon Reservoir is constructed over Barakar River. The streams are mostly ephemeral and are active during the rainy season. The drainage pattern is dendritic to sub-dendritc with medium drainage density. Most of the first and second order streams are cultivated. A large number of man-made lakes/ponds are abundant in the area. Near to the mining area, most of the streams are high polluted.

There are numbers of river/stream flowing in Jamtara district.

3.8 Demography:

An official Census 2011 detail of Jamtara, a district of Jharkhand has been released by Directorate of Census Operations in Jharkhand. Enumeration of key persons was also done by census officials in Jamtara District of Jharkhand.In 2011, Jamtara had population of 791,042 of which male and female were 404,830 and 386,212 respectively. In 2001 census, Jamtara had a population of 653,081 of which males were 333,514 and remaining 319,567 were females. Jamtara District population constituted 2.40 percent of total Maharashtra population. In 2001 census, this figure for Jamtara District was at 2.42 percent of Maharashtra population. There was change of 21.12 percent in the population compared to population as per 2001. In the previous census of India 2001, Jamtara District recorded increase of 19.85 percent to its population compared to 1991.

Table 3.10: Jamtara Town Census 2011 Data - Census 2011

3.9 Connectivity in Jamtara District:

Railway

Jamtara is on the main line of the Eastern Railway from Howrah to Delhi and there are two more Railway Station in Jamtara District, one is Chittaranjan and another one is Karmatanr Vidyasagar.

Roads

Roads in the district: -

- Jamtara – Ranchi – Road - The total straight-line distance between Jamtara and Ranchi is 167 KM (kilometers) and 800 meters. The miles-based distance from Jamtara to Ranchi is 104.3 miles. This is a straight-line distance and so most of the time the actual travel distance between Jamtara and Ranchi may be higher or vary due to curvature of the road. The driving distance or the travel distance between Jamtara to Ranchi is 244 KM and 936 meters. The mile based, road distance between these two-travel point is 152.2 miles.
- Jamtara - Patna– Road- Distance between Patna to jamtara is 331 kms
- Jamtara – Hawra- Road- Distance beteewnJamtara to Hawra is 241 kms
- Jamtara- Chitranjan- Road- Distance between Jamtara to Chitranjan is 14 kms

4. PHYSIOGRAPHY OF THE DISTRICT

4.1 General Landforms:

Jamtara district is situated in the north-eastern part of Jharkhand State. The district is situated in the northern plain of India and eastern plateau and hill region. It is a part of Hazaribag plateau. It has been divided into four sub-micro regions, viz., Dumka-Godda uplands, Deoghar uplands, Rajmahal Hills and Pakur uplands on the basis of geological factors like relief, soil, climate, geology and natural vegetation.

Geomorphologically, the district can broadly be divided into three well defined physiographic units (a) Hilly area (b) Rolling Valleys and (c) Pediplain flat country. The general elevation of the area ranges between 150 m–640 m above MSL. The general slope of the district is from north to south-east. Major soil types are Alfisols amongst which Red Sandy soils are common and Ultisols of which red and yellow soils are common.

The area is characterized by undulating topography with hills and plain. The district is located in Rajmahal highland. It consists of rolling open land surface with long ridges and interveining depressions. The highest and lowest elevation identified in north western and south eastern part of the district. The area having a relief of above + 354 amsl constitutes scaterred hill features of pre-cambrian rocks. In central part of the district near ajay river basin elevation range occurs between 97-156 above MSL. Eastern zone of the district is mostly low land area whereas western part of the district is generallyupland area. The digital elevation model of Jamtara district has been prepared and shown in figure -

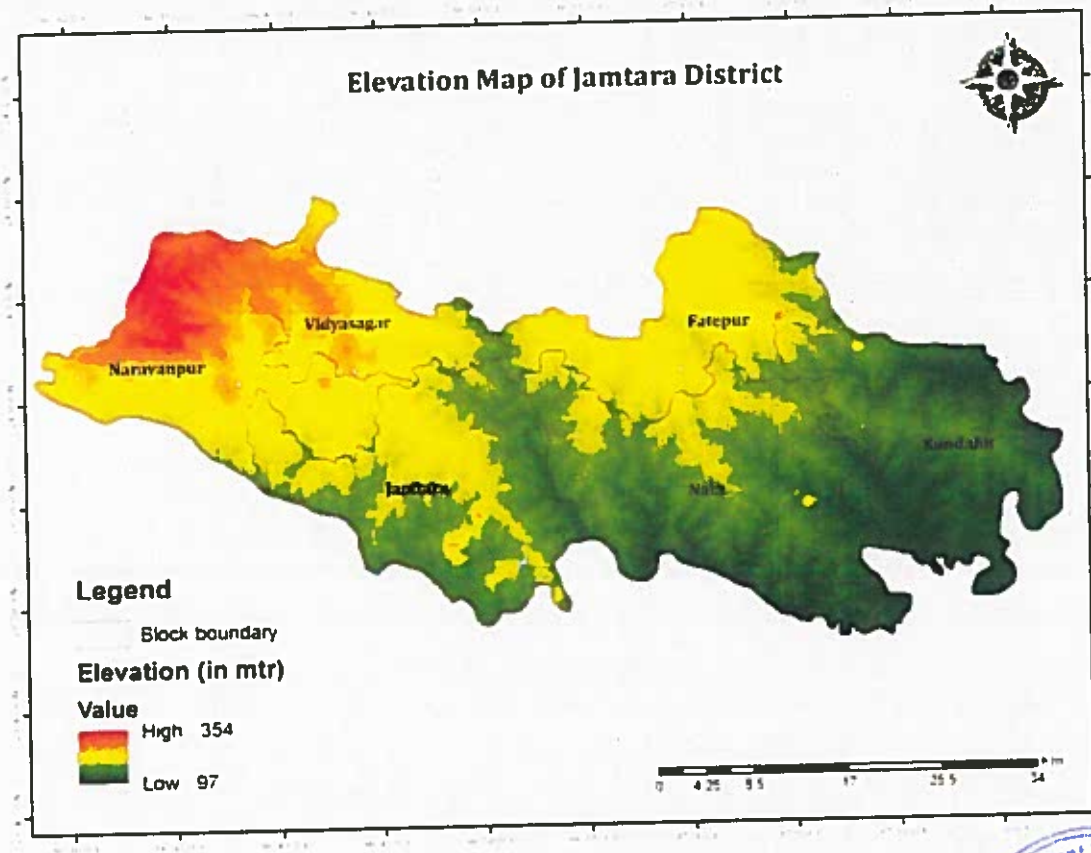

Fig. 4.1: Elevation Map of Jamtara district

Jharkhand, Ranchi

4.2 Soil:

The Soil map of the total area of Jamtara district indicates that 41.87 km² is covered by townships, water bodies, mines, Gullied land etc. A major area of 1641.41 km² of the district is covered by metamorphic soils while the very small area of the district i.e., 0.10 km² is covered by Rajmahal trappean soils. An area of 110.03 km² is covered by Gondwanas soils. The metamorphic soils cover area lying in all part of the district except few patches on NE side. Similarly, the Gondwanas soils are exposed in central and NE part of district. Some sporadic patches are also occurring on SW part of the district. The trappean soils coves a small area in central part of district.

Soil–Landform relationship

The Soil units have good correlation with physiographical units. The mapping unit number 1, 2, and 14 lie on hills and ridges covering an area of 17.48 km². These soils are severely eroded since the slope is > 15%. These Soils are mostly covered by forest cover and are well drained. While mapping unit 4, 5, 6, and 11 lie on upper Pediplain covering an area of 441.40 km². These Soils are moderately eroded with slopes less than 3%. The land use on the Soil is forest and open scrubs.

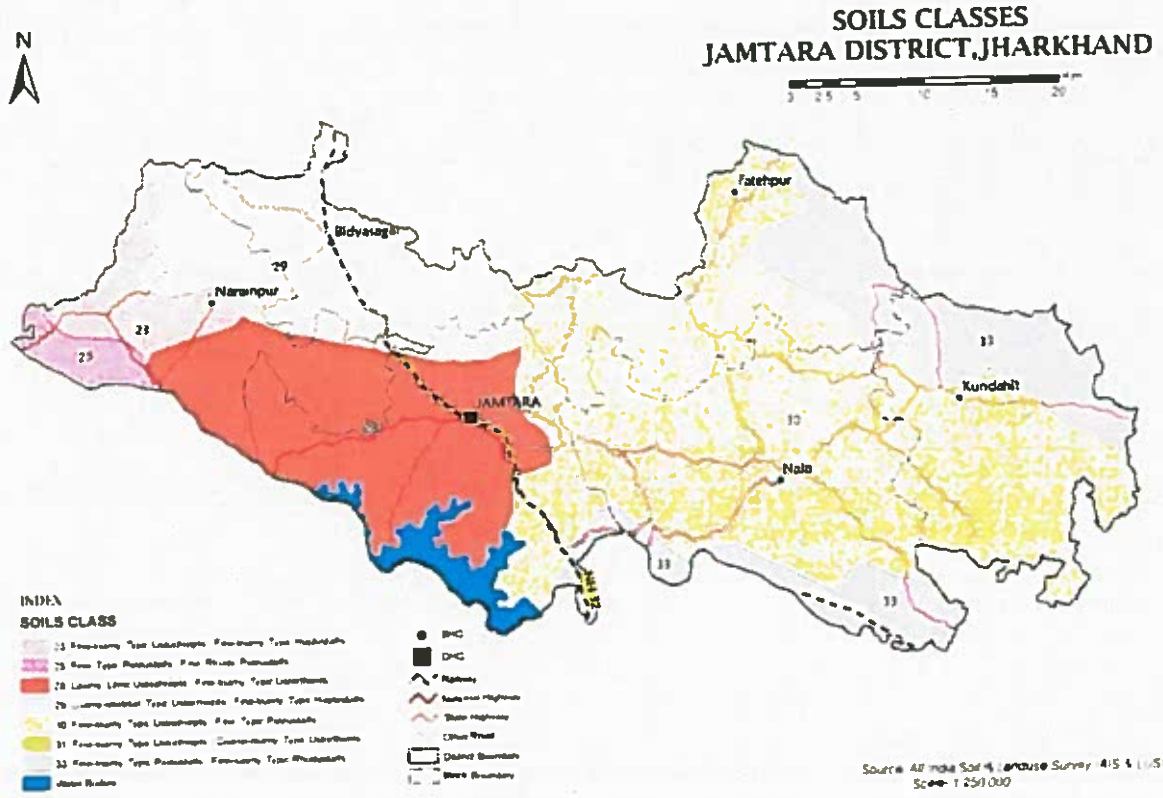

Figure 4.2: Soil Map of Jamtara
(Source - Jharkhand Space Application Center)

4.3 Geomorphology:

Geomorphologically, the district can broadly be divided into three well defined physiographic units (a) Hilly area (b) Rolling Valleys and (c) Pediplain flat country. The general elevation of the area ranges between 150 m–640 m above MSL. The general slope of the district is from north to south-east.

State Level Environment Impact Assessment Authority
Jharkhand, Ranchi

Jamtara district is predominantly a hilly district with certain pockets of plain land. The hilly part covers an area of 17.48 km² area. The district is located in Rajmahal highland. It consists of rolling open land surface with long ridges and intervening depressions. Average elevation of the district ranges between 150 to 300 metres. Geologically, the area is comprised with Basaltic trap and Sedimentary beds. Quartz and Gneiss are found at some places.

5. LAND UTILIZATION PATTERN OF THE DISTRICT

Land is an important resource available to the mankind. Proper planning and utilization of land is important not only in the betterment of an individual, but also contributes to the development of a nation. Landuse planning depends on several factors: climate, soil character, ground water level, water availability, rainfall and terrain condition. The analysis of land use in the present study is based on district statistical magazine, data available at block level and revenue office. Following categories of land use have been recognized in the study area.

1. Agriculture, Cropland, Plantation: Agriculture is the main land use in the area. Most of the first and second order streams in the area are cultivated. Most of the cultivated lands are located towards the central part of the study area. Rice is the principle crop grown in these areas. Other crops include paddy, maize, oilseeds, vegetables etc. These are the lands primarily used for farming and for production of food, fiber, and other commercial and horticultural crops. Cropland includes land under crops (irrigated and unirrigated, fallow, plantations etc.). These are the areas with standing crop as on the date of satellite overpass. Cropped areas appear in bright red to red in color with varying shape and size in a contiguous to noncontiguous pattern. They are widely distributed in different terrains; prominently appear in the irrigated areas irrespective of the source of irrigation.
2. Settlement/Build up-Urban: Jamtara block is the largest urban settlement in the area. It is an area of human habitation developed due to non-agricultural use and that has a cover of buildings, transport and communication, utilities in association with water, vegetation and vacant lands.
3. Barren/Wasteland/Unculturable, Barren Rcky: Scattered patches of the areas with the bad land topography is also present in the area. Most of the barren land area is present near to the coal mines.
4. Mining: Abundant coal mining activities is observed in the southern part of the study area. Presently working quarries are opencast mechanised projects. These open cast mining is mostly restricted to the Barakar Formation, towards the southern part of the area.
5. Rural: Large numbers of small and big rural area are widespred in the district. All the agricultural villages covering 5 Hectares area and more are included in this category. These are the built-up areas, smaller in size, mainly associated with agriculture and allied sectors and non-commercial activities with population size less than 5000, generally lack supporting facilities that are unique to urban areas like hospitals, industries (large and medium scale), institutional etc. They appear in dark bluish green in the core built-up area and bluish in the periphery; the size varies from small to big; irregular and discontinuous in appearance; can be seen in clusters con-contiguous or scattered.
6. Forest: Dense to open mixed jungles are present the study area, especially around the Maithon reservoir. These forested areas usually occupy the high topographic contours. Lodwa forest (Δ326) is an open mixed forest. Durgapur (Δ360) is an example of dense mixed forest.
7. Open Scrub: open scrubs are wide spread towards the south of the Ajay river. They mostly occupy flat to gently undulating area.

5.1 Forest:

Out of total geographical area of 1811 km², forest area covers nearly 106.02 km². The tribal economy revolves around using forest products. by products and minor products. Kendu leaves. Bamboo and its manufactured products, Mahua, fruits, leaves lac etc. play a role in the economic activity of the people. People also hunt animals for food and 'Jani shikar' festival is related to this hunting habit.

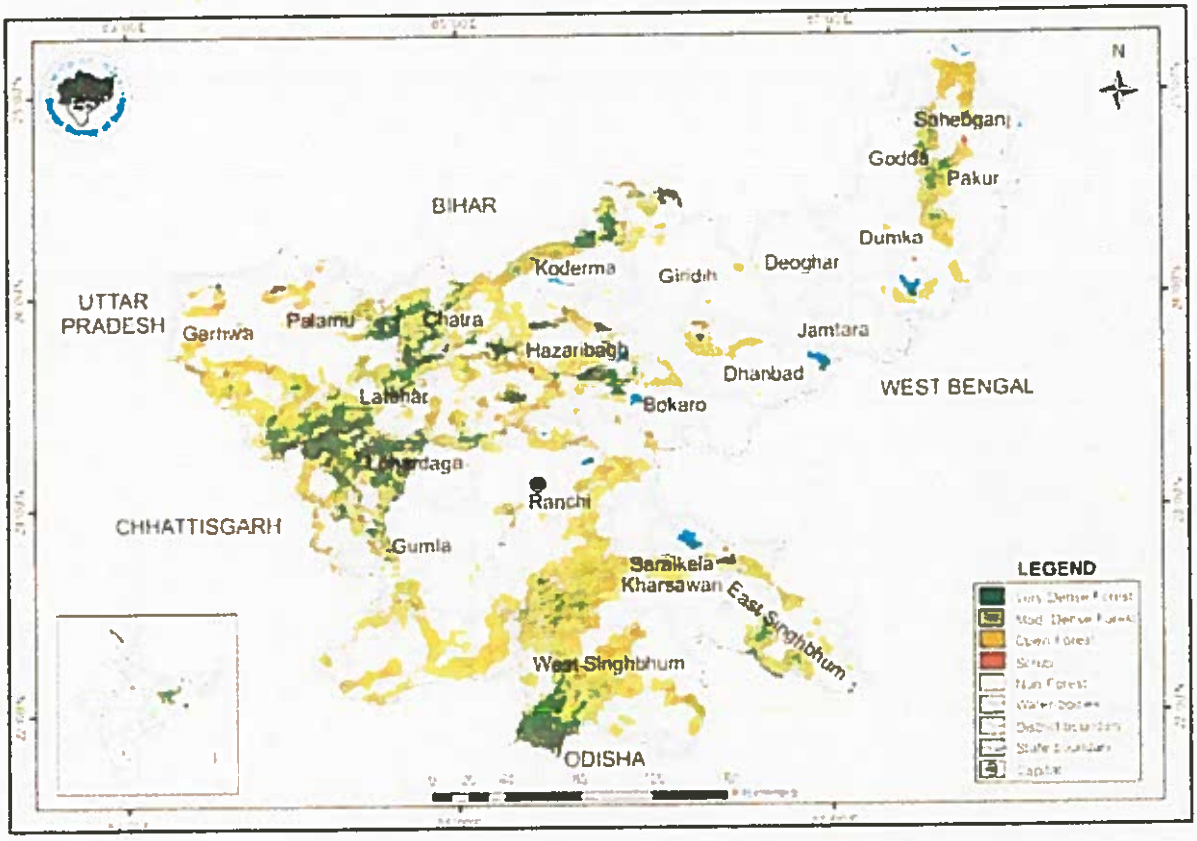

Fig. 5.2: Forest Cover Map of Jharkhand
(Source: India Survey of Forest Report, 2021)

The Jamtara district is with good area covered under the Forest. Forest is mostly present on the east-west part of the district. Because of the human intervention forest has not been spared even on hills. There are a few reserves forest situated in Jamtara district. The vegetations generally traced in Jamtara district are timber species like Sheesham, Teak, Gamhar.

Common Trees in Jamtara district –

Sal – *Shorea robusta*
Mahua – *Madhuca longifolia*
Arjun – *Terminalia arjuna*
Asana – *Pterocarpusmarsupium*
Mango – *Mangifera indica,*
Neem – *Azadirachta indica,*
Tamarind – *Tamarindus indica*

5.2 Agriculture & Irrigation:

Agriculture is the main land use in the area. Most of the first and second order streams in the area are cultivated. Most of the cultivated lands are located towards the central part of the study area. Rice is the principle crop grown in these areas. Other crops include paddy, maize, oilseeds, vegetables etc. These are the lands primarily used for farming and for production of food, fiber, and other commercial and horticultural crops. Cropland includes land under crops (irrigated and unirrigated, fallow, plantations etc.). These are the areas with standing crop as on the date of satellite overpass. Cropped areas appear in bright red to red in color with varying shape and size in a contiguous to non-contiguous pattern. They are widely 9 distributed in different terrains; prominently appear in the irrigated areas irrespective of the source of irrigation.

Rice is the principal crop grown in the area. Wheat, Barley, Maize, Gram, Mustard, Tur, Sugarcane Potato are the other crops in the area. The crops are mainly monsoon dependent. The varieties of plantations which are commonly found are Sal, Acacia, Sisoo and Eucalyptus. The floral

6. GEOLOGY & MINERAL WEALTH

6.1 Geology:

Geologically, Jamtara districtis represented by Chhotanagpur Granite-Gneiss of Archaean age to Proterozoic, which are overlain by Gondwana Super Group, Rajmahal basaltic lava flows (Upper Jurrassic to lower cretaceous age) with intertrappean beds and at places Laterites and Alluvium (as per GSI).

The Chhotanagpur Gneissic Complex is largely represented lithological unit in the area and covers the major part of the district uninterruptedly. They form more or less gently undulating plains and high grounds pediments and buried pediments, seldom giving rise to small hillocks mounds. They are mostly biotite gneisses and granite gneisses and in general coarse grained with porpyhroblastic texture and traversed by Pegmatitite and Quartz vein of various dimensions. It contains enclave of Amphibolites and Mica Schists. The Precambrian formations are overlain by Gondwana formations. Gondwanas are represented mainly by Barakar and Talchir formation in the form of a strip running roughly in the NW-SE direction. However, an isolated patch of this formation is also found to occur in the central part of the district. A Talchir formation consists of Sandstone and Shale. Barakar formation consists of white to fawn colored coarse grained Sandstone, Grits with occasional Conglomerates and Carbonaceous Shales, thin lenticles and streaks of Coal are found in this formation. Common plant fossils occurring in Barakar Shales include Gangomopteris, Cyclopteris, glossopteris Indica and vertebraria Indica.

The pre-cambrian formations/Gondwana formation are further overlapped by Rajmahal Traps consists of Basaltic lava flows with sedimentary intra-trappeans. The basaltic rocks are hard and fine to medium grained. Some of the lava flows are vesicular and cavities being filled by Calcite and Chalcedony. The non vesicular lava flows are hard, tough, compact and fine to medium grained in nature. The vesicular types are comparatively soft and breaks easily. They are greenish to dark in colour with number of flows not clearly delineated in this district. In general, the Rajmahal traps show vertical to horizontal joints trending E-W and N-S. Typical columnar joints are also common. These rocks are weathered with characteristic spherical exfoliation which gives rise to large rounded boulders as the out crops. It has been proved that basalts too are productive when either weathered or fractured.

The Laterites are found in patches over Rajmahal traps at few locations. The alluvium patches are generally seen along major streams. Narrow, discontinuous patches of alluvium particularly in granitic country are identified. They comprise medium to 17 coarse grained sand associated with silt and clay. Occasionally calcareous nodules are also found to occur. They are light grey to brownish colour. The thickness of the alluvium varies from place to place and is largely controlled by topography of the basement crystallines.

In the district, the rocks are highly deformed and metamorphosed. The exposure of Granite and other associated rocks show intricate folding. Based on morphotectonic analysis, the area has undergone several phases of tectonic deformations which leads to various sets of fractures, fissures, faults etc which leads to lineaments. Based on lineament study of the area, various sets of fractures have been identified.

The general geological succession as encountered in Jamtara district (As per GSI) is given below

6.2 Overview of Mineral Resources:

As Stated earlier, the geology of the area is mainly comprised of Chhotanagpur Gneissic Complex which cover the most part of the Jamtara district, it is quite monotonous consisting of Granitic Gneiss rocks in most of the areas. These basement rocks are traversed by dolerite dyke and pegmatites, therefore most of the mining activity revolve around Stone and Quartz mining.

State Level Environment Impact Assessment Authority
Approved
Jharkhand, Ranchi

Jamtara district is rich in many minor minerals Such as Granite Gneiss, Dolerite and Quartz/ Feldspar etc. Coal (Major mineral) was also reported from some areas in Nala CD Block and Fatehpur CD Block of the district. Sand mining also prevalent in many River channels of the district.

Mainly three types of Minor minerals constituents such as Sand, Stone and Bajri are required for any type of construction apart from other material like cement and steel. In the earlier time, the mud houses/buildings were constructed with the use of mud. However, with the passage of time, new techniques of development activities were started. As such the demand of Minor mineral started on an increasing trend. In order to meet the requirement of raw material for construction, the local residents used to lift sand etc. from the river beds to meet out their bonafide requirement. However, after coming into being "The Jharkhand Minor Mineral Rules 2017", the mining is regulated in accordance with the rules. Jamtara is rich in minerals such as Sand, Stone, Quartz, Feldspar, Granite gneiss. Sand mining is mainly practiced in Ajay, Barakar, Hingla, Kuruli, Shiddheshwari River of Jamtara district.

10. DEMAND & SUPPLY OF THE MINERAL IN THE DISTRICT

The demand for Sand is ever growing with the growth of the infrastructure sector in our country. The mineral is used mainly in the construction activities like buildings, bridges etc. The requirement for the mineral is always high in the cities and towns. Therefore, there is always a good demand of the mineral in the domestic market.

A study by the Indian Institute of Technology-Bombay (IIT-B) has estimated that the annual demand for Sand in urban India is 60 million metric tonnes. To put the amount in perspective, the national demand for Sand stands at an average of 1kg per person per day in urban India, according to IIT-B.

From construction to cosmetics, society uses Sand in unexpected ways, and quite literally, is built on it. India's Sand demands pose a difficult market to target. The unbridled demand for Sand leaves India devastated by extensive and unsustainable mining practices and promotes illegal operations in other districts and countries. Expected shortages of sand only spike the need for illegal mining activities. Although no official data shares the amount of Sand mined illegally, the amount sufficiently thwarts State and District-level bodies attempts to reduce unlawful mining operations. Most countries, including India, regulate sand mining through environmental and national regulation, entrusting States to enforce laws and regulation. India is a union of States; there is a demarcation of power between Union and State legislatures. The Mines and Minerals Act 1957 and the Mines Act 1952 are the major national statutes steering India's mining sector. These acts provide power to State legislatures to frame legal outlines for the mining of Minor minerals like that of Sand.

(Source: https://www.hidustantimes.com)

The demand of Sand in Jamtara district is already high as only 4 Nos. of Sand Ghats were operated in district up to the F.Y. 2021-022. Although, demand of Sand becomes three times more with respect to supply within district. Therefore, 21 nos. of potential Sand Ghats have been identified and incorporated in this DSR which could meet the requirement and reduce the demand-supply gap of Sand in future.

11. PROCESS OF DEPOSITION OF SEDIMENTS IN THE RIVERS OF THE DISTRICT

11.1 Classifying Rivers - Three Stages of River Development:

These categories are: Youthful, Mature and Old age. A Rejuvenated River, one with a gradient that is raised by the earth's movement, can be an old age river that returns to a Youthful State, and which repeats the cycle of stages once again.

Characteristics found in the 3 Stages of River Development

YOUTHFUL RIVER:

Perhaps the most dynamic of all rivers is a *Youthful River*. Characteristically youthful rivers are found at higher elevations, in mountainous areas, where the slope of the land is steeper. Water that flows over such a landscape will flow very fast. Youthful rivers can be a tributary of a larger and older river, hundreds of miles away and, in fact, they may be close to the headwaters (the beginning) of that larger river.

Fig. 11.1: Cross-section of Youthful River Channel

MATURE RIVER:

The Mature River is an in-between stage. The river still down cuts though to a much lesser degree than the Youthful River does but it also erodes laterally, though not as extensively, when compared to the Old Age River. The landscape over which it passes is steep enough that the river's slope enables a velocity capable of moving not only the finer sediments, but also the larger pebbles and cobbles by way of rolling, bouncing and saltation along the river bed. The area through which the river flows may be mountainous but they will not be as high as the Young River's locale. A "hilly" landscape would be a better description for the surrounding area. Rapids are absent and so is the V-shaped channel. The channel of a Mature River is U-shaped but deeper than and not as wide as the Old Age river's channel.

State Level Environment Impact Assessment Authority ★ Jharkhand, Ranchi ★ Approved

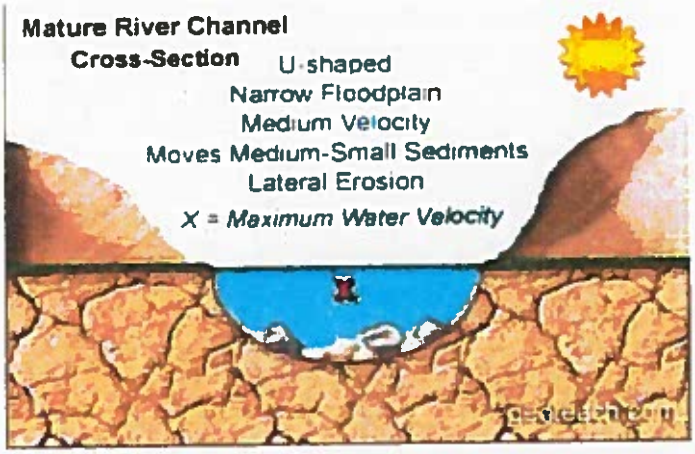

Fig. 11.2: Cross-section of Mature River Channel

OLD AGE RIVER:

Old rivers flow slowest and their rate of erosion is encounter acted by the degree of sediment they deposit. Their course is no longer straight and widened floodplains are a common characteristic. An old river rests in an almost flat valley as a result of the many years of erosion that have taken place.

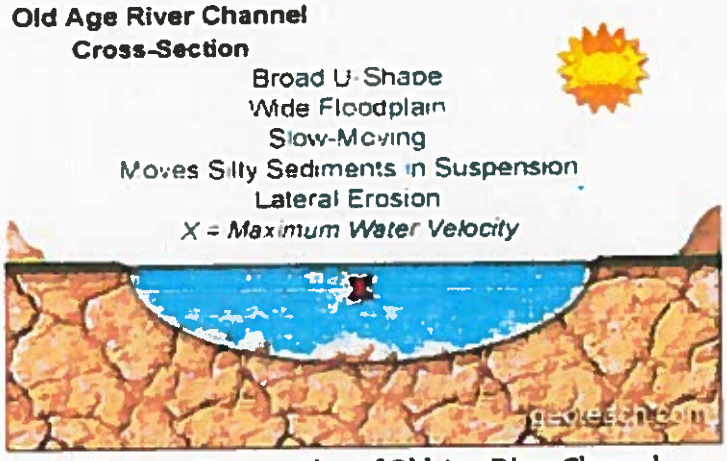

Fig. 11.3: Cross-section of Old Age River Channel

11.2 Stream Erosion and Deposition

Flowing water is a very important mechanism for both erosion and deposition. Water flow in a stream is primarily related to the stream's gradient, but it is also controlled by the geometry of the stream channel. As shown in Figure, water flow velocity is decreased by friction along the stream bed, so it is slowest at the bottom and edges and fastest near the surface and in the middle. In fact, the velocity just below the surface is typically a little higher than right at the surface because of friction between the water and the air. On a curved section of a stream, flow is fastest on the outside and slowest on the inside.

State Level Environment Impact Assessment Authority
Approved
Jharkhand, Ranchi

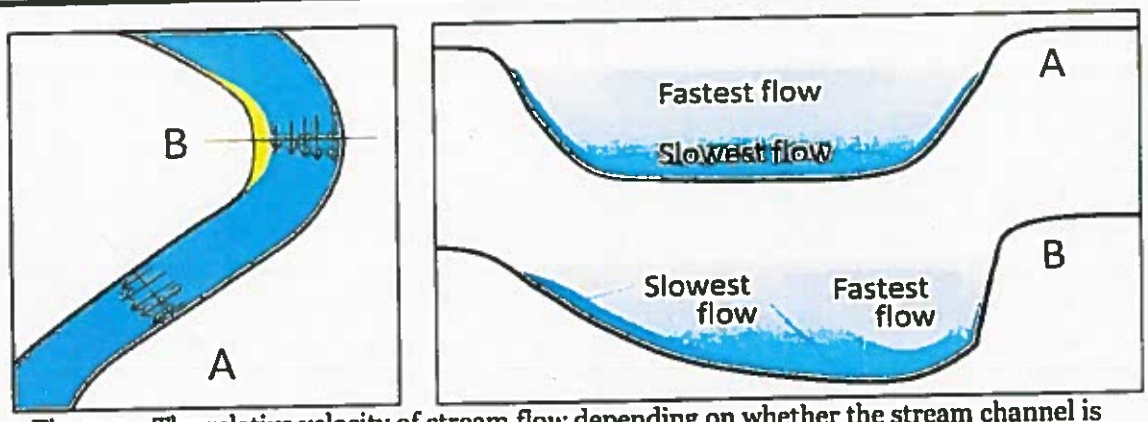

Fig. 11.4 - The relative velocity of stream flow depending on whether the stream channel is straight or curved (left), and with respect to the water depth (right)

Other factors that affect stream-water velocity are the size of sediments on the stream bed — because large particles tend to slow the flow more than small ones — and the discharge or volume of water passing a point in a unit of time (e.g., m^3/second). During a flood, the water level always rises, so there is more cross-sectional area for the water to flow in; however, as long as a river remains confined to its channel, the velocity of the water flow also increases.

Figure 11.5 shows the nature of sediment transportation in a stream. Large particles rest on the bottom — bedload — and may only be moved during rapid flows under flood conditions. They can be moved by saltation (bouncing) and by traction (being pushed along by the force of the flow).

Smaller particles may rest on the bottom some of the time, where they can be moved by saltation and traction, but they can also be held in suspension in the flowing water, especially at higher velocities. As you know from intuition and from experience, streams that flow fast tend to be turbulent (flow paths are chaotic and the water surface appears rough) and the water may be muddy, while those that flow more slowly tend to have laminar flow (straight-line flow and a smooth water surface) and clear water. Turbulent flow is more effective than laminar flow at keeping sediments in suspension.

Stream water also has a dissolved load, which represents (on average) about 15% of the mass of material transported, and includes ions such as calcium (Ca+2) and chloride (Cl-) in solution. The solubility of these ions is not affected by flow velocity.

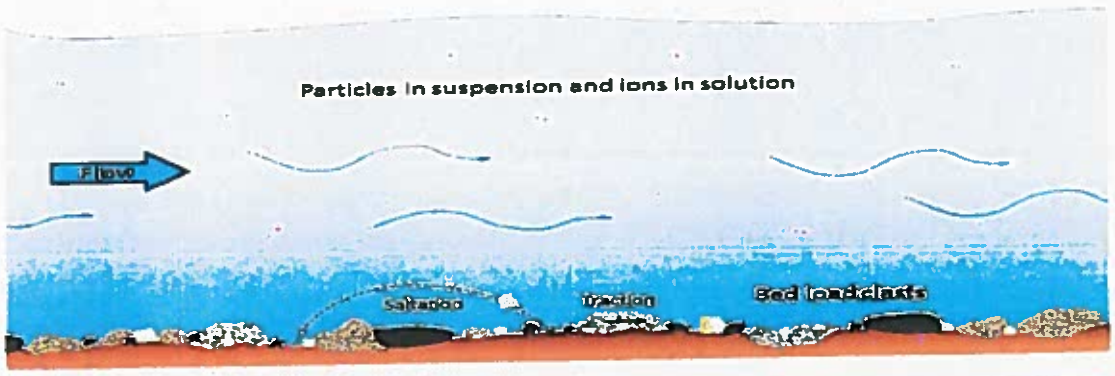

Figure 11.5: Modes of transportation of sediments and dissolved ions (represented by red dots with + and – signs) in a stream. [SE]

State Level Environment Impact Assessment Authority
Approved
Jharkhand, Ranchi

The faster the water is flowing, the larger the particles that can be kept in suspension and transported within the flowing water. However, as Swedish geographer Filip Hjulström discovered in the 1940's, the relationship between grain size and the likelihood of a grain being eroded, transported, or deposited is not as simple as one might imagine. Consider, for example, a 1 mm grain of sand. If it is resting on the bottom, it will remain there until the velocity is high enough to erode it, around 20 cm/s. But once it is in suspension, that same 1 mm particle will remain in suspension as long as the velocity doesn't drop below 10 cm/s. For a 10 mm gravel grain, the velocity is 105 cm/s to be eroded from the bed but only 80 cm/s to remain in suspension.

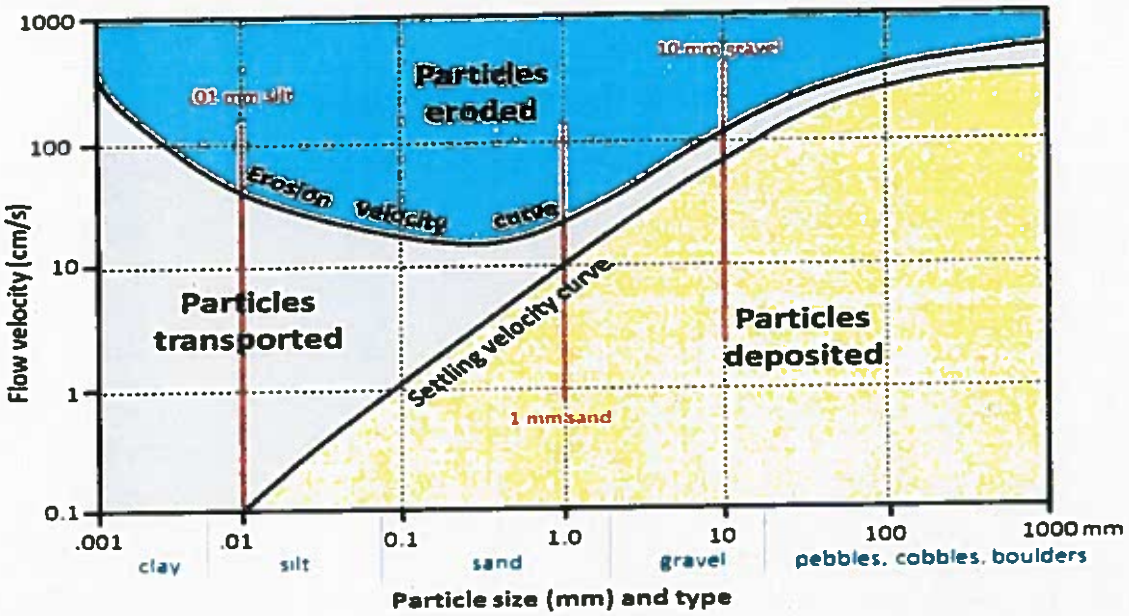

Figure 11.6: The Hjulström-Sundborg diagram showing the relationships between particle size and the tendency to be eroded, transported, or deposited at different current velocities

On the other hand, a 0.01 mm silt particle only needs a velocity of 0.1 cm/s to remain in suspension, but requires 60 cm/s to be eroded. In other words, a tiny silt grain requires a greater velocity to be eroded than a grain of sand that is 100 times larger! For clay-sized particles, the discrepancy is even greater. In a stream, the most easily eroded particles are small sand grains between 0.2 mm. and 0.5 mm. Anything smaller or larger requires a higher water velocity to be eroded and entrained in the flow. The main reason for this is that small particles, and especially the tiny grains of clay, have a strong tendency to stick together, and so are difficult to erode from the stream bed.

It is important to be aware that a stream can both erode and deposit sediments at the same time. At 100 cm/s, for example, silt, sand, and medium gravel will be eroded from the stream bed and transported in suspension, coarse gravel will be held in suspension, pebbles will be both transported and deposited, and cobbles and boulders will remain stationary on the stream bed.

A stream typically reaches its greatest velocity when it is close to flooding over its banks. This is known as the bank-full stage, as shown in figure. As soon as the flooding stream overtops its banks and occupies the wide area of its flood plain, the water has a much larger area to flow through and the velocity drops significantly. At this point, sediment that was being carried by the high-velocity water is deposited near the edge of the channel, forming a natural bank or **levée.**

खनन पदाधिकारी
जामताड़ा

State Level Environment Impact Assessment Authority * Jharkhand * Ranchi
Approved

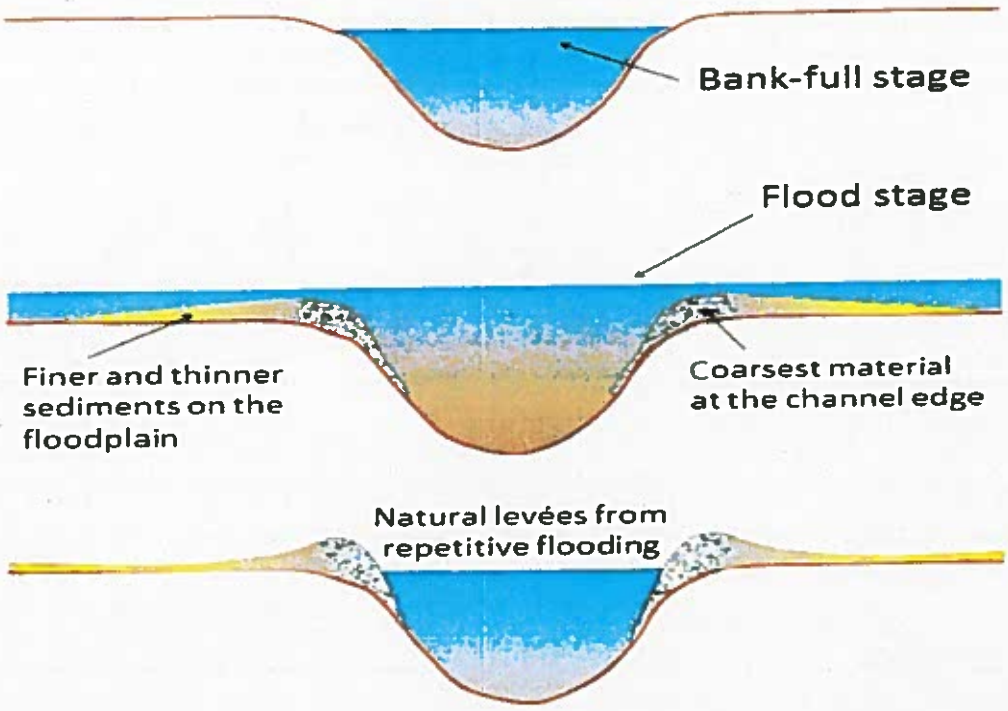

Figure 11.7: The development of natural levées during flooding of a stream. The sediments of the levée become increasingly fine away from the stream channel, and even finer sediments — clay, silt, and fine sand are deposited across most of the flood plain. [SE]

11.3 Flood Plain:

Flood-plain is an area of land adjacent to a stream or river which stretches from the banks of its channel to the base of the enclosing valley walls, and which experiences flooding during periods of high discharge. The soils usually consist of clays, silts, and sands deposited during floods.

Flood-plains are formed when a meander erodes sideways as it travels downstream. When a river breaks its banks, it leaves behind layers of alluvium (silt). These gradually build up to create the floor of the plain. Flood plains generally contain unconsolidated sediments, often extending below the bed of the stream. These are accumulations of sand, gravel, loam, silt, and/or clay, and are often important aquifers, the water drawn from them being pre-filtered compared to the water in the river.

Level Environment Impact Assessment Aut
Approved

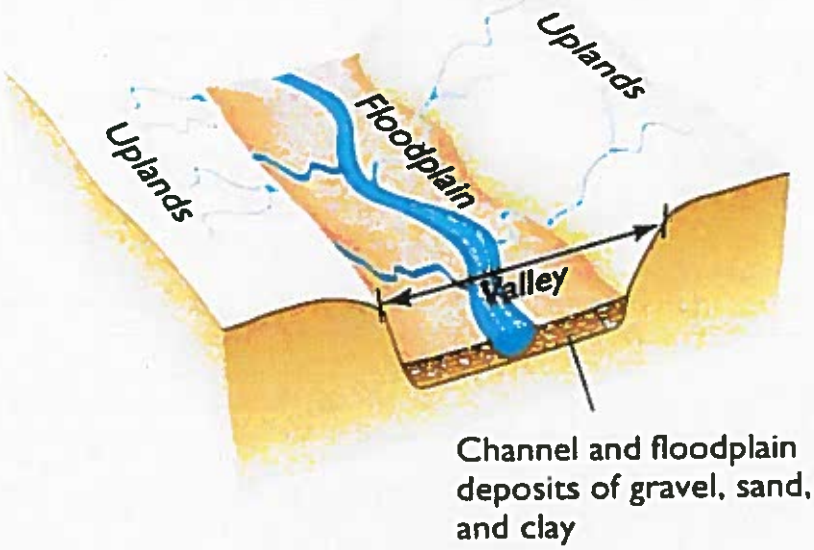

Figure 11.8: Flood Plain

11.4 Replenishment of Sand:

The deposition in a river bed is more pronounced during rainy season although the quantum of deposition varies from stream to stream depending upon numbers of factors such as catchment, lithology, discharge, river profile and geomorphology of the river course where annual deposition is one meters, but it is noticed that during flood season whole of the pit so excavated is completely filled up and as such the excavated area is replenished with new harvest of minerals.

In order to calculate the mineral deposits in the stream beds, the mineral constituents have been categorized as clay, silt, sand, bajri and boulder. However, during present calculation, the waste material i.e. silt which vary from 10 to 20% in different streams has also been included in the total production. Further the Survey of India Topo-Sheets are used as base map to know the extent of river course. The mineral reserves have been calculated only upto 1.00-meter depth although there are some portions in the river beds such as channel bars, point bars and central islands where the annual deposition is raising the level of river bed thus causing shifting of the rivers towards banks resulting in to cutting of banks and at such locations, removal of this material up to the bed level is essential to control the river flow in its central part to check the bank cutting. While calculating the mineral potentials, the mineral deposits lying in the sub- tributaries of that particular River/Stream has not been taken into consideration. Since, these mineral deposits are adding annually.

11.5 Surface Runoff:

Also known as overland flow is the flow that occurs when excess storm water, melt water, or other sources flows over the Earth's surface. This might occur because soil is saturated to full capacity, because rain arrives more quickly than soil can absorb it, or because impervious areas (roofs and pavement) send their runoff to surrounding soil that cannot absorb all of it. Surface runoff is a major component of the water cycle. It is the primary agent in soil erosion by water.

Runoff that occurs on the ground surface before reaching a channel is also called a nonpoint source. If a nonpoint source contains man-made contaminants, or natural forms of pollution (such as rotting leaves) the runoff is called nonpoint source pollution. A land area which produces runoff that drains to a common point is called a drainage basin. When runoff flows along the

ground, it can pick up soil contaminants including petroleum, pesticides, or fertilizers that become discharge or nonpoint source pollution.

In addition to causing water erosion and pollution, surface runoff in urban areas is a primary cause of urban flooding which can result in property damage, damp and mold in basements, and street flooding.

- **Effects of Surface Runoff:**

Erosion and deposition

Surface runoff can cause erosion of the Earth's surface; eroded material may be deposited a considerable distance away.

There are four main types of soil erosion by water:

- Splash Erosion,
- Sheet Erosion,
- Rill Erosion,
- Gully Erosion.

Splash erosion is the result of mechanical collision of raindrops with the soil surface: soil particles which are dislodged by the impact then move with the surface runoff.

Sheet erosion is the overland transport of sediment by runoff without a well-defined channel.

Soil surface roughness causes may cause runoff to become concentrated into narrower flow paths: as these incise, the small but well-defined channels which are formed are known as **rills.** These channels can be as small as one-centimeter-wide or as large as several meters.

If runoff continue to incise and enlarge rills, they may eventually grow to become **gullies.**

Figure 11.9: Soil erosion by water on intensively-tilled farmland.

Gully erosion can transport large amounts of eroded material in a small time period. Reduced crop productivity usually results from erosion, and these effects are studied in the field of soil conservation. The soil particles carried in runoff vary in size from about .001 millimetre to 1.0 millimeter in diameter. Larger particles settle over short transport distances, whereas small particles can be carried over long distances suspended in the water column.

There are many sediment transport equations which are suitable for use in the prediction of the

State Level Environment Impact Assessment Authority * Jharkhand, Ranchi *
Approved

replenishment rate of rivers/ watershed. Some of the Famous sediment transport equations are:

1. Dandy–Bolton Equation
2. Yang Equations
3. Engelund-Hansen Equation
4. Modified Universal Soil Loss Equation (MUSLE)

- **Dandy-Bolton Equation**

Dandy Bolton formula is often used to calculate the sedimentation yield. But use of these equations to predict sediment yield for a specific location would be unwise because of the wide variability caused by local factors not considered in the equations development. However, they may provide a quick, rough approximation of mean sediment yields on a regional basis for preliminary watershed planning. They include climate, drainage area, soils, geology, topography, vegetation and land use. Studies revealed that sediment yield per unit area generally decreases as drainage area increases. As drainage area increases, average land slopes usually decrease; and there is less probability of an intense rainstorm over the entire basin. Both phenomena tend to decrease sediment yield per unit area. In arid regions, sparse precipitation and low run-off are the limiting factors. As precipitation increases, density of vegetation also increases, resulting in less erosion. In areas with adequate and evenly distributed precipitation, vegetation thus becomes the limiting factor. The accuracy of the sedimentation surveys varied, ranging from reconnaissance type measurements of sediment deposits to detailed surveys consisting of closely spaced cross-sections or contours. Runoff data are translated to inches per year per unit area and sediment deposition data to tons per year per square mile of net drainage area. Net drainage area is defined as the sediment-contributing area and normally excluded areas above upstream reservoirs or other structures that were effective sediment traps. Actual sediment yields undoubtedly were slightly higher because most reservoirs do not trap inflowing sediment.

Sediment Yield vs. Drainage Area: - On the average, sediment yield is inversely proportional to the 0.16 power of drainage area between 1 and 30,000 miles^2.

Sediment Yield vs. Runoff: - Sediment yield increased sharply to about 1,860 tons per mile^2 per year as run-off increased from 0 to about 2 inches. As runoff increased from 2 to about 50 inches, sediment yield decreased exponentially. Because sediment yield must approach zero as runoff approaches zero, a curve through the plotted points must begin at the origin. The abrupt change in slope of a curve through the data points at Q equals 2 inches precluded the development of a continuous function that would adequately define this relationship. Thus, there are two equations derived for when Q was less than 2 inches and when Q was greater than 2 inches.

- **Combined Effect of Drainage area and Surface Run off on Sediment Yield**

Dandy-Bolton determined the combined influence of runoff and drainage area on sediment yield to compute the sediment yield. They developed two equations i.e. for run off less than 2 inch and for run off more than 2 inch, which are given below: -

Where: S = Sediment yield (tons/miles^2/yr.)
Q = Mean Annual runoff (inch)
A = Net drainage are in miles^2

For run off less than 2 inches.

(Q<2in) S=1289*(Q) 0.46*[1.43-0.26 Log (A)] F

For runoff more than 2 inches.

(Q>2in): S=1958*(e-0.055*Q) *[1.43-0.26Log (A)]

- **Universal Soil Loss Equation**

Sediment loss from water erosion
Modeling sediment loss

MUSLE is a modification of the Universal Soil Loss Equation (USLE). USLE is an estimate of sheet and rill soil movement down a uniform slope using rain- fall energy as the erosive force acting on the soil.
(Wischmeier and Smith 1978). Depending on soil characteristics (texture, structure, organic matter, and permeability), some soils erode easily while others are inherently more resistant to the erosive action of rain- fall.
MUSLE is similar to USLE except for the energy component. USLE depends strictly upon rainfall as the source of erosive energy. MUSLE uses storm-based runoff volumes and runoff peak flows to simulate erosion and sediment yield (Williams 1995). The use of runoff variables rather than rainfall erosivity as the driving force enables MUSLE to estimate sediment yields for individual storm events. The water erosion model uses an equation of the form:

$$Y = X \times EK \times CVF \times PE \times SL \times ROKF$$

where:

Y	=	sediment yield in tons per hectare
EK	=	soil erodibility factor
CVF	=	crop management factor that captures the relative effectiveness of soil and crop management systems in preventing soil loss
PE	=	erosion control practice factor (including management practices such as terraces, contour farming, and strip cropping)
SL	=	slope length and steepness factor
ROKF	=	coarse fragment factor

For estimating MUSLE, the energy factor, X, is represented by

$$X = 1.586 \times (Q \times q)^{0.56} \times WSA^{0.12}$$

where:
Q = runoff volume in millimeters
qp = peak runoff rate in millimeters per hour WSA = watershed area in hectares
Runoff volume is estimated using the SCS curve number method. Peak flow was estimated using a modification of the rational method which relates rainfall to peak flow on a proportional basis. The rational equation is:

$$Q = C \times i \times A$$

where:
q = peak flow rate
C = runoff coefficient representing watershed characteristics
i = rainfall intensity for the watershed's time of concentration
A = watershed area

Note:

To estimate the replenishment of Sand, the pre-monsoon (First & Second Survey) data has been assessed through study of Satellite imageries and data provided by District Mining Office to establish the initial level of mining lease before the monsoon.

Keeping in view the 'Generic Structure of Replenishment Study' (as per EMGSM 2020); Third Survey after the monsoon has been carried out to estimate the quantum of material deposited/replenished in the mining lease.

The Fourth Survey shall be carry out at the end of March in coming year to know the quantity of material excavated during the financial year.

The results of year-wise surveys help the State Government to establish the replenishment rate of the River. Based on the replenishment rate future auction may be planned.

State Level Environment Impact Assessment Authority * Jharkhand, Ranchi * Approved

12.4 Jharkhand State Sand Mining Policy 2017:

- **Categorization of Streams/Rivers:**

a. Identification of the Sand available in different order of streams such as 1st, 2nd, 3rd, 4th, 5th order or more shall be carried out by the District Survey Committee based on its size and capacity.

b. Based on District Survey Report the Survey Committee shall categorize the River in 1st order and 2nd order stream/river as Category-1 and 3rd order and above as Category-2.

c. However, based on recommendation of District Survey Committee and depending upon local conditions/requirements, the State may review and change the positioning of a particular order of Stream/River into a particular category of Category-1 or Category-2.

- **Management of Sand Deposits of Category-1 Streams/Rivers:**

a. The Sand deposits of Category-1 Stream/Rivers will be kept fully free from domain of grant of mining lease.

b. The Sand from this category can be used only for non-commercial purposes such as domestic purpose, Community purposes, Government Sponsored Schemes etc. or as defined in Appendix–IX of Part–II–Section-3-Sub Section-(ii) of Extraordinary Gazette of MoEF & CC, Government of India New Delhi dated 15th January 2016.

c. Gram Panchayat/Local Self Government shall be responsible for supervision of sand collection from such area.

d. There shall be no transfer or subletting of the sand deposits from these Streams/Rivers.

e. The Sand from these Streams/Rivers shall be free from any taxes, royalty or levy.

f. For the purpose of maintenance of the approach road, management, supervision etc. a nominal Maintenance Charge shall be levied by Gram Panchayat/Local Self Government per unit volume of sand lifted/collected/dispatched, as per the rate decided by Department of Industries, Mines and Geology, Government of Jharkhand.

g. It shall be responsibility of Gram Panchayat/Local Self Government to ensure that Sand from these deposits is not used for any commercial purposes and to regulate the same, a receipt-cum dispatch challan will be issued by the Gram Panchayat/Local Self Government in the format as prescribed by the State.

h. The maintenance charge so collected shall be deposited in the account of Gram Panchayat/Local Self Government.

i. The book keeping of this account shall be maintained by Gram Panchayat/Local Self Government according to prevailing rules and guidelines of the Gram Panchayat/Local Self Government.

j. Under no circumstances the sand shall be allowed to be stored from these Streams/Rivers.

k. As mentioned in para 7-(i) - (B) of Part–II–Section-3-Sub Section-(ii) of Extraordinary Gazette of MoEF & CC, Government of India, New Delhi dated 15th January, 2016 such usage of Sand shall be exempted from environmental clearance.

l. This shall be the responsibility of the Gram Panchayat/Local Self-Government to restrict Sand mining in prohibited areas as directed by the Department.

m. Under no circumstances mechanized lifting of Sand shall be allowed from these category of Streams/Rivers.

n. The Deputy Commissioner shall put in place proper administrative/enforcement mechanism to ensure no commercial/illegal extraction of Sand from these orders of Streams/Rivers.

State Level Environment Impact Assessment Authority Approved Jharkhand, Ranchi

- **Management of Sand Deposits of Category-2 Streams/Rivers: -**

a. The Sand deposits of Category-2 shall be managed by State Government through Jharkhand State Mineral Development Corporation Limited (JSMDC).

b. All the Sand deposits in Category-2 shall be allocated to JSMDC for a minimum period of 5 years or more as decided by the Government.

c. Sand shall be sold by the JSMDC on commercial basis.

d. The sale price of Sand shall be decided by JSMDC in consultation with the Government.

e. JSMDC shall obtain all clearances such as Environmental Clearance, Mining Plan or any other statutory requirements for Sand mining, storage and sale.

f. JSMDC shall ensure compliance of all applicable rules, regulations, guidelines, directives of honourable courts etc.

g. JSMDC shall ensure that no Sand mining is carried out in any such zone or depth as prohibited under MoEF & CC Guidelines.

h. JSMDC shall adopt scientific and sustainable mining practices and shall ensure a transparent, fair and effective delivery system.

i. JSMDC shall adopt appropriate technology such as RFID/GPS tracking of vehicles, CCTV surveillance, central monitoring, cashless online sale etc. to prevent illegal mining and transportation of Sand.

j. State shall reimburse the entire expenditure incurred by JSMDC for operation and maintenance of Sand Ghats and also pay suitable agency commission as fixed by the Government.

The Government may review the Sand Mining Policy in future as and when required and issue Guidelines or Amendments accordingly.

Sand deposit zones has been identified through field survey and study of Satellite imageries over the entire stretch of the River within the district. After physical verification of those deposition zones, only Sand potential areas are considered for Sand Ghats. After leaving safe distance from all physical structures, forest, habitation etc. as per statute, limiting coordinates of each Sand Ghat has been fixed.

In order to reduce the cluster formation, size of a Sand Ghat has been kept as large as possible, covering the entire Sand bar inside single Sand Ghat after leaving statutory distances.

Apparently, all the Sand Ghats which are located on 1st and 2nd order of Stream, are considered as *Category - 1* Sand Ghats. Apart from this, all such Sand Ghats, which don't comply with the statutory norms in terms of distance from habitation and forest to obtain Environment Clearance for commercial mining are also considered as *Category - 1* Sand Ghats, which shall be consumed by local villagers for their domestic use. All other identified Sand Ghats are considered as *Category - 2* Sand Ghats, proposed for commercial mining.

State Level Environment Impact Assessment Authority

Impact Assessment Authority
Approved
Jharkhand, Ranchi

Note:

To estimate the replenishment of Sand, the pre-monsoon (First & Second Survey) data has been assessed through study of Satellite imageries and data provided by District Mining Office to establish the initial level of mining lease before the monsoon.

Keeping in view the 'Generic Structure of Replenishment Study' (as per EMGSM 2020); Third Survey after the monsoon has been carried out to estimate the quantum of material deposited/replenished in the mining lease.

The Fourth Survey shall be carry out at the end of March in coming year to know the quantity of material excavated during the financial year.

The results of year-wise surveys help the State Government to establish the replenishment rate of the River. Based on the replenishment rate future auction may be planned.

13. DETAILS OF ECO-SENSITIVE AREA IN THE DISTRICT

As per Notification issued by MoEF & CC, there is no any Eco-Sensitive area fall in Jamtara district.

State Level Environment Impact Assessment Authority
Approved

14. IMPACT ON THE ENVIRONMENT DUE TO MINING

14.1 For Sand Mining:

The environmental components that are likely to be influenced or modified by the continuation of mining activities are: Air, Water, Noise, Soil, Hydrology, Ecology & Bio-diversity, Socio-economic status etc.

Major activities involve in the operation phase are -

- Excavation,
- Loading of material on truck by excavator
- Movement of vehicle on 'kaccha' road of villages

✓ Air Pollution

In mining activity, the only source of air pollution is excavation, transportation, loading and handling of minerals etc. The proposed mining operations are not anticipated to raise the concentration of pollutants beyond prescribed limits. However, the measures are suggested to mitigate the negative impact of the proposed mining activity to control the pollutants by plantation of trees along haul roads, specially near settlements, to help to reduce the impact of dust on the nearby villages; planning transportation routes of mined material so as to reach the nearest paved roads by shortest route (minimize transportation over unpaved road); regular water sprinkling on unpaved roads to avoid dust generation during transportation etc.

Emission of PM_{10}

The major sources of PM10 emission in case of sand mining project are the loading activity at mine site (loading of material over trucks/trucks by excavators) and the movement of vehicles on unpaved haul roads.

Loading of Material

The excavated materials will be loaded on dumpers using excavators.

Emission of PM10 due to Transportation

The hauling of minerals from the mine lease area to the end users via haul road (unpaved road) will cause emission of particulate matters. This emission will be limited to the extent of unpaved haul road starting from mining pit to nearest paved road connectivity.

Emission of CO from Vehicles

The excavated minerals will be transported outside the mining area for end use. The ARAI emission factors for CO emitting from heavy vehicles (diesel) is 3.92 gm/km or 6.32 g/mile.

Air Emissions

- Dust and air emission particularly due to the excavation, construction and movement of vehicles resulting in air pollution.
- No. of PCU/Hr. will increase due to mining in existing traffic scenario lead to air pollution which can cause adverse effect on human health of neighboring villagers like effect on breathing and respiratory system, damage to lung tissue, cancer and premature death, influenza or asthma.

✓ Noise Pollution

- Noise Impact due to mining activities.
- Human Noise from the machinery can cause hypertension, high stress level, hearing loss, sleep disturbance etc. due to prolonged exposure.
- Increase in the existing traffic due to this mining activity may occur unwanted sound and can also cause impact on human health of neighbouring villagers like effect on breathing and respiratory system, damage to lung tissue, cancer and premature death, influenza or asthma.

Approved

जिला खनन पदाधिकारी
जामताड़ा

✓ Water Pollution

- Flow pattern might be changed due to River-bed mining.
- Mining activities depth will be increased, which may result in increase of flow velocity.
- Change in surface water quality and ground water quality.
- Impact on ground water recharge potential as the thickness of the natural filter materials (sediments) is reduce causing less infiltration.
- Waste water discharge.

✓ Soil Environment

- Mining activity may increase the soil erosion and soil degradation which have adverse impact on soil fertility.
- Top soil extraction from outside riverbed may also affect the soil fertility and productivity.
- During the flood, the soil erosion may occur.

✓ Solid Waste Generation/Management

- Flow pattern might be changed due to River-bed mining.
- Mining activities depth will be increased, which may result in increase of flow velocity.
- Waste water discharge.

✓ Land Use

- The mining activity in the outside River-bed will be converted into the pit, which may cause soil erosion, soil degradation etc.
- Mining in the riverbed may change complete land use pattern including channel geometry, bed elevation, sediment transportation capacity which can reduce flow of the River and downstream erosion.

✓ Hydrology

- The mining in the riverbed area may cause the ground water contamination due to intersection of the water table.
- Change the topography will divert the River flow.
- Change in topography can change the River flow and flood may occur.
- Slope of mining area will change which can create soil erosion and divert rain water runoff channel.

✓ Topography, Drainage and Ground Water Contamination

- Spillage of oil from construction/transportation vehicles and equipment.

✓ Biological Environment

- Transportation of sand in the trucks/dumper will disturb the movement of wild animals like jungle cat, jackal, and other reptiles. Fugitive emission from vehicle movement will form a layer in leaves thus reducing the gaseous exchange process. This ultimately affects the growth of plants. Chances of vehicle collisions with wildlife attempting to cross roads are possible.
- Rivers, stream & Waterbodies in the district are habitats of various waterbirds and majority of migratory birds travelling from Siberia, Central Asia, Tibet, The Himalayas to the district during migratory season.
- Any human settlement in the mining area will disturb the vegetation cover and reptiles
- Indiscriminate mining from active channels of rivers causes many adverse effects on the benthic fauna, which inhabits the bottom sandy substratum. Excessive sand extraction from rivers affects the eco-biology of many terrestrial insects whose initial life history begins in aquatic environments
- Stomatal index may be minimized due to dust deposit on leaf.

✓ Socio-economic

- Such shops along the roads will generate solid waste and waste water which will have adverse impact on human health.
- Further, the deep pits created in the channel also can contribute to an increase in accidents on the working environment.

State Level Environment Impact Assessment Authority * Jharkhand, Ranchi * Approved

जिला खनन पदाधिकारी जामताड़ा

Adequate control measures will be adopted to check not only the wash-off from soil erosion but also uncontrolled flow of mine water.

✓ Noise Pollution

Mining operations involve deployment of mining machineries, drilling, blasting, excavation and transportation of stone. Noise may be generated by the impact from drill bits and mechanical vibration from drill casings, as well as impulse noise from exhaust and ancillary equipment such as fans and blowers for mine ventilation.

✓ Land Environment

The creation of landscape blots like open pits and piles of waste rocks due to mining operations can lead to the physical destruction of the land at the mining site. Such disruptions can contribute to the deterioration of the area's flora and fauna. There is also a huge possibility that many of the surface features that were present before mining activities cannot be replaced after the process has ended. The removal of soil layers and deep underground digging can destabilize the ground which threatens the future of roads and buildings in the area.

State Level Environment Impact Assessment Authority * Jharkhand, Ranchi * Approved

15. REMEDIAL MEASURES TO MITIGATE THE IMPACT OF MINING ON THE ENVIRONMENT

15.1 Remedial Measures for Sand Mining:

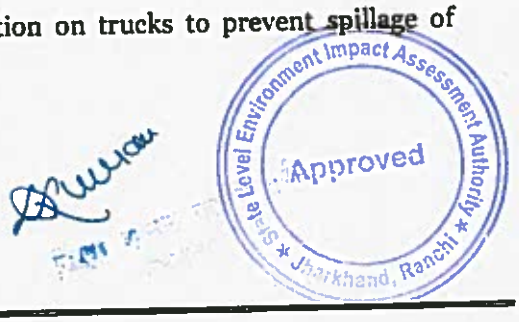
✓ Air Environment:

During mining activity, the only source of air pollution is excavation, transportation, loading and handling of minerals etc. However, the measures are suggested to mitigate the negative impact of the proposed mining activity to control the pollutants by plantation of trees along haul roads, specially near settlements, to help to reduce the impact of dust on the nearby villages; planning transportation routes of mined material so as to reach the nearest paved roads by shortest route (minimize transportation over unpaved road); regular water sprinkling on unpaved roads to avoid dust generation during transportation etc.

Impact	Mitigation Measures
Air Emissions • Dust and air emission particularly due to the excavation, construction and movement of vehicles resulting in air pollution.	• Provision of spraying water to reduce dust emission on roads and particularly near existing settlements. • Excavated topsoil to be preserved and reused for landscaping. • The amount of exposed ground and stockpiles will be minimized so that re-suspension due to wind and subsequent dust fall is prevented. Heights of stock piles should control dust fall in nearby areas. • Arrangement of the soil will be such that existing drainage pattern, though altered, will still ensure that runoff does not carry away topsoil but reaches the water bodies with which it is linked. Ensuring all vehicles, generators and compressors are well maintained and regularly serviced.

The following measures are suggested to mitigate any negative impacts of mining:

- Planned multiple transportation routes in different direction to minimize the dust generation.
- Planned paved roads outside mine lease area to minimize the dust generation. Alternatively, planning transportation routes so as to reach the nearest paved roads by shortest route. (Minimize transportation over unpaved road).
- Frequent water sprinkling on unpaved roads (>2L/m²).
- Plantation of trees along haul roads, especially near settlements, to reduce the impact of dust on the nearby villages.
- Dust mask shall be provided to the workers engaged at dust geineration points like excavations and loading points.
- Transportation of material shall be carried out during day time only.
- The speed of trucks plying on the haul road should limited to 20 km/hour to avoid generation of dust.
- Covering of material by tarpaulin during transportation on trucks to prevent spillage of materials from the trucks.
- Overloading shall be avoided.



Movement of Traffic:

Impact	Mitigation Measures
• No. of PCU/Hr. will increase due to mining in existing traffic scenario lead to air pollution which can cause adverse effect on human health of neighboring villagers like effect on breathing and respiratory system, damage to lung tissue, cancer and premature death, influenza or asthma.	• Vehicles with PUC Certificate will be hired. Regular maintenance of vehicles will be done to ensure smooth running of vehicle. It is proposed to plant local species trees per year with consultation of Forest department with some fruit bearing and medicinal trees, along the haul roads, outer periphery within the lease area to prevent the impact of dust in the nearby village. Regular Health checkup camps will be organized.
• No. of PCU /Hr will increase in the existing traffic due to this mining activity hence vehicle collation may occur unwanted sound and can also cause impact on human health.	• In addition, truck drivers will be instructed to make minimum use of horns in the village area and sensitive zones. It is proposed to plant local species trees per year with consultation of Forest department with some fruit bearing and medicinal trees, along the haul roads, outer periphery within the lease area to reduce the impact of noise in the study area. Regular Health checkup camps will be organized.
• Accidents may be occurring due to fast movement of vehicles.	• To avoid accidents, the speed of vehicles will be low near habitation areas.

✓ **Noise Pollution:**

It can be stated that the impact on the present noise levels due to mining operations will be minimal and shall be restricted to transportation route only. There is no drilling and blasting envisaged in the Sand mining so there is no impact of vibration.

Impact	Mitigation Measures
• Noise Impact due to mining activities. • Human Noise from the machinery can cause hypertension, high stress level, hearing loss, sleep disturbance etc. due to prolonged exposure. • Increase in the existing traffic due to the mining activity may occur unwanted sound and can also cause impact on human health of neighboring villagers like effect on breathing and respiratory system, damage to lung tissue, cancer and premature death, influenza or asthma.	• Noise generated be this equipment will be intermittent and does not cause much adverse impact. • The noise measurement data indicated that present noise levels in the study area is within the permissible limits of National Ambient Noise Quality Standards. • Periodical monitoring of noise will be done. • No other equipment except the transportation vehicles and excavator for loading will be allowed. • Proper maintenance of all equipment / machines will be carried out which help in reducing noise during operations. • In addition, truck drivers will be instructed to make minimum use of horns in the village area and sensitive zones. • Plantation will be taken up along the approach roads and vicinity of river bank. The plantation minimizes propagation of noise and also arrests dust. • Ear muffs will be provided while working on mining equipment. • Regular health check-ups will be conducted for any such health implications

✓ Water Environment:

Impact	Mitigation Measures
• Flow pattern might be changed due to river bed mining. • Mining activities depth will be increased, which may result in increase of flow velocity.	• No diversion is anticipated. There will not be any adverse impact on flow pattern, surface hydrology and ground water regime. • Mining activities will be restricted to maximum 3 m depth, which will not cause much change in flow pattern of the river.
• Change in surface water quality and ground water quality.	• The mining will not be allowed below the water table. • Regular monitoring of water samples will be done as precautionary measures.
• Impact on ground water recharge potential as the thickness of the natural filter materials (sediments) is reduce causing less infiltration.	• Mining will be done as per approved Mine Plan and applicable Rules & Regulation, so that there is no damage on ground water recharge potential due to sand mining.
• Waste water discharge.	• Portable Bio-toilets will be used; hence no sewage/liquid effluent will be generated and contamination is also not expected due to percolation.

✓ Soil Environment:

Impact	Mitigation Measures
• Mining activity may increase the soil erosion and soil degradation which have adverse impact on soil fertility.	• It is already proposed to plant local species trees per year with consultation of Forest department with some fruit bearing and medicinal trees, along the haul roads, outer periphery within the mining area which enhances the binding property of the soil to check the erosion. • Water will be sprinkled on unpaved roads to avoid dust generation and soil erosion.
• Top soil extraction from outside riverbed may also affect the soil fertility and productivity.	• In case of River-bed, no top soil will be generated during the mining activity.
• During the flood, the soil erosion may occur.	• Mine lease area has been proposed leaving a safety distance from the bank inwards which will protect the banks. Check dams have been constructed at various places for protection of banks against direct attack of the rivers and avoid bank cutting.

✓ Solid Waste Generation/Management:

Impact	Mitigation Measures
• Flow pattern might be changed due to river bed mining. • Mining activities depth will be increased, which may result in increase of flow velocity.	• No diversion is proposed. There will not be any adverse impact on flow pattern, surface hydrology and ground water regime. • Mining activities will be restricted to maximum 3 m depth, which will not cause much change in flow pattern of the River.

Approved

Impact	Mitigation Measures
• Waste water discharge.	• Portable Bio-toilets will be used; hence no sewage/liquid effluent will be generated and contamination is also not expected due to percolation.

✓ **Land Use:**

Impact	Mitigation Measures
• The mining activity in the outside riverbed will be converted into the pit. Which may cause soil erosion, soil degradation etc. • Mining in the riverbed may change complete land use pattern including channel geometry, bed elevation, sediment transportation capacity which can reduce flow of the river and downstream erosion.	• It is proposed to plant of local species trees per year with consultation of Forest department with some fruit bearing and medicinal trees, along the haul roads, outer periphery within the mining area which enhances the binding property of the soil. • The mining is planned in non-monsoon seasons only so that the excavated area will be replenished naturally during the subsequent rainy season for the river bed mining block. • Mine lease area has been proposed leaving a safety distance from the bank inwards which will protect the banks so channel geometry will not be disturbed. Check dams have been constructed at various places for protection of banks against direct attack of the rivers and avoid bank cutting. • Pre and post monsoon survey for sedimentation in the River-bed will be done regularly.

✓ **Hydrogeology:**

Impact	Mitigation Measures
• The mining in the River-bed area may cause the ground water contamination due to intersection of the water table. • Change the topography will divert the river flow. • Change in topography can change the river flow and flood may occur. • Slope of mining area will change which can create soil erosion and divert rain water runoff channel.	• The water table will not be intersected during mining in the River-bed as ultimate depth is limited Proper analysis/monitoring will be done to check the ground and surface water • There is no proposal of any stream modification/diversion due to this mining activity hence there will be no any impact on flow of the River. • Mining will be prohibited in monsoon season. • The maximum depth of mining in the River-bed will not exceed 3 meters and the maximum depth of mining in outside riverbed will not exceed.

✓ **Topography, Drainage and Ground Water Contamination:**

Impact	Mitigation Measures
• Spillage of oil from construction/transportation vehicles and equipment.	• Spillage of oil from construction vehicles and equipment will be avoided. These should be inspected by supervisor for any leakage of oil. • Collection of water in pits will be avoided. • Contamination of soil will be avoided by suitable soil conservation measures.

✓ **Biological Environment:**

State Level Environment Impact Assessment Authority
Approved
Jharkhand, Ranchi

Impact	Mitigation Measures
• Transportation of Sand in the trucks/dumper will disturb the movement of wild animals like jungle cat, jackal, and other reptiles. Fugitive emission from vehicle movement will form a layer in leaves thus reducing the gaseous exchange process. This ultimately affects the growth of plants. Chances of vehicle collisions with wildlife attempting to cross roads are possible.	• Transportation of sand will only be day time. Access roads will not encroach into the riparian zones.
• Any human settlement in the mining area will disturb the vegetation cover and reptiles	• No human settlement will be permitted in the lease mining or nearby area. No mining will be carried out during the rainy season to minimize impact on aquatic life.
• Indiscriminate mining from active channels of River causes many adverse effects on the benthic fauna, which inhabits the bottom sandy substratum. Excessive sand extraction from River affects the eco-biology of many terrestrial insects whose initial life history begins in aquatic environments.	• Mining will be done only in River-bed and outside River-bed as per provided by DMG so there will be no impact on benthic fauna in River-bed hence no mitigation will be required.

✓ **Socio-economic:**

Impact	Mitigation Measures
• Due to mining and transportation of Sand will generate the small shops, dhabas, garage, restaurant, vegetable shops etc. along the road and generate direct employment.	• Positive Impact
• Mining activity will generate direct employment which will be employed locally and preference will be given to local people.	• Positive Impact
• Such shops along the roads will generate solid waste and waste water which will have adverse impact on human health.	• Garbage bins will be provided for proper disposal of solid waste.
• Further, the deep pits created in the channel also can contribute to an increase in accidents in the working environment.	• The mined-out area outside river bed block will be reclaimed and any stored water will be pumped out.
• This creates serious threat to residents in the area who depend on river water for their domestic purposes.	• The mining is planned in non-monsoon seasons only so that the excavated area will be replenished naturally during the subsequent rainy season for the river bed mining block.
• The major source of socio-health impacts of transportation will generate from truck, dust etc. Increase in accidents as a result of rash	• It is proposed to plant of local species per year with consultation of Forest department with some fruit bearing and medicinal trees,

Impact	Mitigation Measures
driving of dumpers carrying mineral through the roads may be possible.	along the haul roads, outer periphery within the mining area to control the dust. • Planning transportation routes of mined material so as to reach the nearest paved roads by shortest route. (minimize transportation over unpaved road). Alternatively, gravelled road may be constructed between mine lease area and nearest paved road connectivity; The speed of trucks plying on the haul road should limited to avoid generation of dust; and Covering of material during transportation on trucks to prevent spillage of sand from the trucks. The trucks will be covered by tarpaulin. Overloading will be avoided. • Regular water sprinkling on unpaved roads to avoid dust generation during transportation.

15.2 Remedial Measures for other than Sand Mining:

▪ Remedial Measures for Air Pollution:

- All machineries and transport vehicles will be properly maintained and pollution check will be done once in a year to keep the emissions from machineries and vehicle under control.
- Water sprinkling will be done on haul road to control emission of dust while transporting minerals and waste. Provision for water spray by tankers on 'kaccha' road shall be done.
- Water sprinkling at loading area.
- Tree plantation along the haul roads & approach road will be done. Plantation along the mine boundary shall be done with tree density of 2000 trees per Hectare as per the norms of MoEF & CC, to control dust & noise.
- Use of personal protective equipment like dust mask.
- Ambient air pollution monitoring will be carried out.

▪ Remedial Measures for Water Pollution:

- Mining is proposed to plan above the ground water table. Therefore, pumping of ground water from mine pit does not arise in this mine. The rain water during rainy season is proposed to settle in a pit and shall be use for dust suppression and plantation. Excess water, if any shall be discharged in natural stream after settling of suspended particles in the pit. Pump having required capacity will be installed to lift accumulated rain water from working pit and pumped to the settling tank.
- Garland drain shall be made around the Waste dump and the rain water shall be collected in garland drain and allowed to settle in a small pit for settling suspended particles before allowing discharge to natural drainage system.
- For domestic waste water Septic Tank with Soak Pit shall be provided, discharge from Soak Pit, if any shall be used for plantation.

▪ Remedial Measures for Noise Pollution:

- Diesel powered machineries, which is major source of noise in open cast mining shall be properly maintained. Attention shall be paid towards rigorous maintenance of the silencer of the diesel engines.
- Protective devices shall be provided for use of persons employed in the vicinity of high noise areas.

Approved

- With the adoption of controlled blasting techniques, the ground vibrations will be minimized.
- Plantation around the lease boundary will cut the noise levels.

▪ Remedial Measures for Land Environment:

Some of the measures followed to minimize the impacts are as follows:

- The mining activities will be restricted within the lease area only.
- The waste material will be utilized for the construction of road and also will be used by the local people for construction work.
- The surface run off from the lease area will be retain within the lease and used for plantation, dust suppression and block cutting. So, there will be no soil erosion from the lease area and its surrounding due to mining activity.
- The dump will have inward slope with catch drains at inward side of the terrace and the catch drain of the individual terrace will be connected to the garland drain outside the periphery of the dump. Retaining wall and garland drain will be constructed around the dumps and the surface runoff water pass through the garland drain and finally settled in a settling pit before released outside.
- Retaining wall and garland drains for the proposed waste dump will be constructed to arrest wash offs from the dump.
- Maintenance/repair of vehicles and machineries will not be inside the mining area. However, steel trays will be used for any emergency repair and sudden leakage of oil.

▪ Remedial Measures for Waste Management:

The solid waste shall be dumped systematically with proper repose angle and stabilization as follows:

- Gradation of dump shall be done automatically as coarser materials go to the bottom and finer at the top and therefore drain of rain water flow freely to the bottom without endangering the stability of dump.
- Stabilization of dump with top soil and tree plantation shall make the dump more stable on long. Dump should be terraced for every 5 m height and stabilized
- 1m height parapet shall be constructed for dumps more than 6m height along the toe to prevent and control wash out from dumps entering into natural system through rain water
- Garland drainage around dump shall prevent under wash of dump by hydrostatic pressure to be developed by surface water and control wash outs and collapse.

▪ Remedial Measures for Flora and Fauna:

Extensive plantation comprising of pollutant resistant trees will be undertaken, which will serve not only as pollution sink but also as a noise barrier. It is proposed to include Azadirachta indica, and Ficus religiosa in the plantation program as they serve as sinks for gaseous emissions.

The impact on the fauna due to the mining activity will be insignificant. The progressive plantation over a period of time will reduce the impact, if any, on the fauna.

State Level Environment Impact Assessment Authority * Jharkhand, Ranchi *
Approved

16. RISK ASSESSMENT & DISASTER MANAGEMENT PLAN

16.1 Risk Assessment for Sand Mining:

Since, Sand mining operation does not attract Mines Act 1952, it does not require any statutory personnels, however the entire operation must be under the supervision of experience qualified person who can handle the labour employment effectively. The person must have knowledge of transportation activities with traffic rule & safety. It is always advisable to appoint such person who can understand the language of Mine plan & implement the same.

1. As such in case of sand mining activities does not have any short of risk in operational activity except prior to start the monsoon period all the manpower & equipment's to be withdrawn to safe location.
2. In case of temporary discontinuation of operation due to natural calamity or labour strike & Risk management plan to be developed based in the local condition.

- **Accidents due to Transportation and Movement of Mining Machineries**

Risks:

Most of the accidents occur during transportation by tippers/trucks and movement of mining machineries.

Mitigation Measures:

- This can be prevented by regular training of all vehicle/machinery drivers/operators, regular maintenance of equipment and ensuring safe operations.
- All safety precautions and provision of MMR 1961 shall be strictly followed during all mining operations.
- Regular maintenance and testing of all mining equipment as per manufacturer's guidelines.
- All transportation within the main working area should be carried out under the direct supervision and control of the management;
- The vehicles must be maintained in good repairs and checked thoroughly at least once a week by a competent person authorized for this purpose by the management;
- Broad signs should be provided at each and every turning point especially for the guidance of the drivers of vehicles.
- To avoid dangers while reversing the trackless vehicles, especially at the embankment and tripping points, all areas for reversing of lorries should, as far as possible, be made man free, and there should be a light and sound device to indicate reversing of trucks; and
- A statutory provision of the fence, constant education, training etc. will go a long way in reducing the incidence of such accidents.

- **Risk Assessment:**

Hazard Identification & Risk Assessment (Hira)

The entire mining operation will be donc under the supervision of the Mines Engineer/Mines manager having second class mines manager's certificate of competency and supported by a team of competent persons. Nevertheless, the following natural/industrial problems may by encountered during the mining operation:

- Accident due to Transportation or movement of heavy machineries.
- Operation of mining equipment.
- Accident due to storage of Fuel.
- Filling of mine due to excessive rain.

State Level Environment Impact Assessment Authority
Approved
Jharkhand, Ranchi

Risk and Mitigation Measures:

Over Burden:

Risks:

The overburden dumps may cause landslides. High overburden dumps created at the quarry edge may cause sliding of the overburden dump or may cause failure of the pit slope due to excessive loading, thereby causing loss of life and property. Siltation of surface water may also cause run-off from overburden dumps.

Mitigation Measures:

- To prevent the failure of overburden slopes, especially during the rainy season, proper garland drain & bund are constructed around the dump.
- To prevent this, height of overburden dumps will be restricted. Further, no stone or loose rock or loose tree will be allowed to remain within 3 meters of the edge of the quarry. To prevent siltation of surface water, retaining wall will be constructed on the down side of each OB dump.

Accidents due to Transportation and Movement of Mining Machineries:

Risks:

Most of the accidents occur during transportation by tippers/trucks and movement of mining machineries.

- Operations of jack hammers are often attributable to mechanical failures and human errors.

Mitigation Measures:

- This can be prevented by regular training of all vehicle/machinery drivers/operators, regular maintenance of equipment and ensuring safe operations.
- All safety precautions and provision of MMR 1961 shall be strictly followed during all mining operations.
- Regular maintenance and testing of all mining equipment as per manufacturer's guidelines.
- All transportation within the main working area should be carried out under the direct supervision and control of the management;
- The vehicles must be maintained in good repairs and checked thoroughly at least once a week by a competent person authorized for this purpose by the management;
- Broad signs should be provided at each and every turning point specially for the guidance of the drivers of vehicles.
- To avoid dangers while reversing the trackless vehicles, especially at the embankment and tripping points, all areas for reversing of lorries should, as far as possible, be made man free, and there should be a light and sound device to indicate reversing of trucks; and
- A statutory provision of the fence, constant education, training etc. will go a long way in reducing the incidence of such accidents.

Fuel Storage:

- No major storage of fuel envisaged in the mining lease area.

Water Logging:

Risks:

Filling of mine pit with excessive rain.

Mitigation Measures:

- Provision of adequate capacity pumps for pumping out water from the mining pit with standby arrangements.

State Level Environment Impact Assessment Authority Jharkhand, Ranchi Approved

- Checking and regular maintenance of garland drainage and earthen bunds to avoid any inflow of surface water into the mine pit.
- Proper drainage will be maintained to eliminate inundation of working pits during rains from run-off water. Suitable garland drain will be provided around pit along with sedimentation pits on each side.
- There is no danger of flood or inundation as the ground level is well below the plateau top, where mining will be carried out.

Safety Measures at Mine:

- The gradient of the haul road inside the pit, access trench and on the dumps will not be steeper than 1 in 16.
- The quarries will be protected by garland drains around the periphery for storm water drainage.

Care and Maintenance during Temporary Discontinuance:

In case of emergency arise as situation of temporary discontinuance due to court order or due to statutory requirements or any other unforeseen circumstances pit will be fenced and locked properly so as no one can enter in pit. All plantation will be protected with all due care for their survival. Maintenance and monitoring of discontinued mining operations i.e. maintenance of haul roads, will be done in view of re-open in near future.

16.2 Disaster Management Plan:

High risk incidents like land slide subsidence, flood, inundation, in the mine, fire, tailing damp failures etc. may occur for which an emergency plan for individual mine to ebb proposed for quick evacuation of men & machinery.

16.3 Vulnerability of the State:

Almost all the 24 districts are affected by different kind of Disaster. There is great need to strengthen the capacity of State, District, Block and newly formed Panchayat level of departments, institutions and functionaries to respond to the Disaster at their own level in participation of community. Jharkhand is vulnerable to following kind of Hazards: -

- Drought,
- Mining Accidents,
- Chemical and Industrial Hazards,
- Lightning,
- Bird Flu,
- Flood,
- Earthquake,
- Fire/Forest Fire,
- Elephant Attacks,
- Climate Change, Biodiversity loss,
- Naxalism/Landmine Blasts etc.

Major Hazards affected districts	Name of Hazards	No. of districts affected	Name of the district
1.	Drought	All the 24 Districts (2010)	All districts affected
2.	Flood	01	(Sahibganj)

Sand Texture Analysis Report

Client Name: Sathi Planners Private Limited
Client Address: Lake Avenue, Kanke Road, Ranchi,
Jharkhand, PIN - 834008
Sample Type: Riverbed Sand
Period of Sampling: 20.10.2022 to 14.11.2022
Sampling Density: Two per Hectare

Source: Multiple Rivers in Jamtara District
Period of Analysis: 18.11.2022 to 24.11.2022
Sample Condition: Sealed

Ghat ID	Area (Ha)	Length (m)	No. of Samples	Sand Sample Collected for texture analysis						Bulk Density
