पत्रांकः–319 दिनांकः–29/10/2023

प्रेषकः

सदस्य सचिव,
राज्य स्तरीय पर्यावरण समाघात निर्धारण
प्राधिकरण (SEIAA), झारखण्ड।

सेवा में,

उपायुक्त,
जिला : साहिबगंज।

विषय : साहिबगंज जिला का बालू खनिज से संबंधित DSR के अनुमोदन के संबंध में।

प्रसंग : आपका कार्यालय का पत्रांक–1139/एम०, दि0–14.10.2023।

महाशय,

उपर्युक्त विषयक आपके कार्यालय के प्रासंगिक पत्र दिनांक 14.10.2023 द्वारा साहिबगंज जिला का बालू खनिज से संबंधित DSR की एक प्रति अनुमोदन हेतु दिनांक 19.10.2023 को SEIAA कार्यालय में समर्पित किया गया।

तद्अनुसार SEAC, झारखण्ड की 110वीं बैठक दिनांक 17.10.2023 से दिनांक 21.10.2023 में Shri Bibhuti Kumar, District Mining Officer, Sahibganj की उपस्थिति में M/s Rian Enviro Pvt. Ltd., Patna, Bihar consultant द्वारा दिनांक 20.10.2023 में SEAC के समक्ष Presentation दिया गया, जिसमें DSR के Salient Feature निम्नवत् बताये गये :–

1. The final DSR submitted is duly signed by all members of the Sub Divisional Committee and the Consultant. All the pages of the DSR are signed by the authorized officer of the Sub Divisional Committee.
2. The final DSR consists of the complete potential area and is demarcated as Potential Resource Area (PRA) / Sand Leases / Ghats as per EMGSM guideline 2020.
3. The replenishment study of pre & post monsoon period is included in final DSR.
4. The final DSR had been placed in the public domain for 01 (One) month from the 01.07.2023. As per the Sub Divisional Committee no comments / observations were obtained.'

5. Demand and supply of the river bed material has been provided. The future demand for next 05 years is included in the final DSR.
6. The PRA / Sand Leases / Ghats have not been proposed on the confluence / meanders / concavieties /active channels of the river.
7. Khata & Khasra numbers of the lease area certified by the concerned Circle Officer (CO) are incorporated in the final DSR.
8. The distance of PRA / Sand Leases / Ghats from the Forest / Wildlife Protected area / Birds Sanctuary/ Wildlife Sanctuary / National Park / Eco Sensitive Zone has been verified and certified by the concerned DFOs of the respective Territorial and Wildlife division.
9. A report detailing the presence of aquatic animal in the river in proximity of the proposed PRA / Sand Leases / Ghats is included in the final DSR.
10. The proposed PRA / Sand Leases / Ghats meet the siting criteria of State Pollution Control Board / SEIAA.
11. High resolution color satellite images of the proposed potential sand mining areas are included in final DSR.
12. Bulk density and specific gravity of sand sample data has been provided by NABL accredited laboratory.
13. Cluster and contiguous cluster formation as per EMGSM guidelines, 2020 has been included in the Annexures.
14. Mining is restricted to 3/4th of the river width and 60% of the mineable reserve.
15. Transportation routes for movement of sand are provided in the final DSR.
16. All the annexures as per EMGSM guidelines, 2020 are included in the final DSR.
17. An undertaking with reference to Point no. 9.3 of the EMGSM guidelines, 2020 regarding monitoring of mining near inter-district or inter-state boundary has been provided.
18. The representative of the Sub Divisional Committee along with the Consultants have affirmed that all the guidelines of EMGSM guidelines, 2020 / Hon'ble Apex Court in Civil Appeal no. 3661-3662/2020, Pawan Kumar vs State of Bihar & ors, Hon'ble NGT in O.A. no. 54/2022/EZ, Bhumi Adhigrahan Visthapan Avam Punarvas Kisan Samiti vs State of Jharkhand & ors have been followed in preparation of the final DSR.

SEAC द्वारा उपरोक्त तथ्यों के आलोक में सर्वसम्मति से आपके द्वारा समर्पित DSR को अनुमोदन हेतु SEIAA को अपनी अनुशंसा भेजी गयी।

SEAC की DSR Sahibganj की अनुमोदन हेतु भेजी गयी अनुशंसा के आलोक में SEIAA, झारखण्ड की 110वी बैठक दिनांक 27.10.2023 से दिनांक 29.10.2023 में विचार किया गया।

विचारोपरांत SEAC द्वारा की गयी अनुशंसा के आलोक में SEIAA द्वारा सर्वसम्मति से **साहिबगंज** जिला का बालू खनिज से संबंधित DSR का अनुमोदन किया गया।

साहिबगंज जिला का बालू खनिज से संबंधित अनुमोदित DSR की एक मूल प्रति अत्र– सह–संलग्न कर आपको अग्रेतर कार्रवाई हेतु भेजी जा रही है।

अनु० यथोक्त।

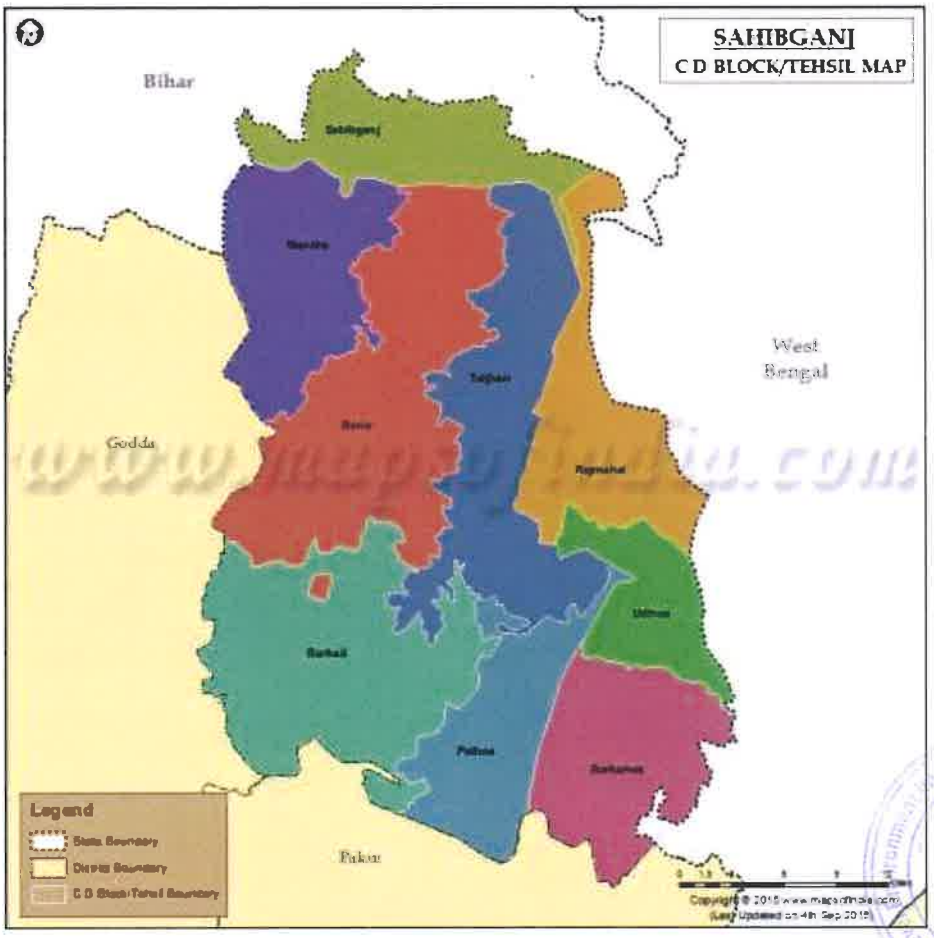
विश्वासभाजन,

सदस्य सचिव,

राज्य स्तरीय पर्यावरण समाघात निर्धारण प्राधिकरण (SEIAA), झारखण्ड।

DISTRICT SURVEY REPORT (DSR) FOR SAND MINERAL OF SAHIBGANJ DISTRICT, JHARKHAND

(As per Notification No. S.O.3611 (E) dated 25th July 2018, Sustainable Sand Mining Management Guidelines, 2016 and Enforcement & Monitoring Guidelines for Sand Mining (EMGSM) January 2020, issued by Ministry of Environment, Forest and Climate Change)



Prepared by

M/S RIAN ENVIRO PRIVATE LIMITED
202 & 402, Mangal Market, Raja Bazar, Sheikhpura, Patna, Bihar, Pin code-800014
Reg. address: 133, Ansal Chamber-II, 6 Bhikaji Cama Place, New Delhi- 110 066
(QCI NABET Accreditation No. - NABET/EIA/2124/IA 0079 Valid till 10.03.2024)

The Deputy Commissioner though its letter 494/M, dated 09.05.2023, had constituted a Sub-Divisional Committee to verified the District Survey Report prepared by Environmental Consultant. List of the members of the Sub-Divisional Committee is as follows: -

क्र. सं.	पदाधिकारी	हस्ताक्षर
1	अनुमंडल पदाधिकारी , साहेबगंज।	09/10/23.
2	वन प्रमंडल पदाधिकारी , साहेबगंज।	9/10/23
3	जिला खनन पदाधिकारी , साहेबगंज।	9/10/23
4	सहायक निदेशक, जिला भूतात्विक कार्यालय, साहेबगंज।	सुभाष 9/10/2023
5	कार्यपालक अभियंता, लघु सिंचाई प्रमंडल , साहेबगंज।	9/10/23
6	क्षेत्रीय पदाधिकारी, J.S.P.C.B राँची।	9/10/23

9/10/23

Plate D	Composite Map

1 Preface

The need for District Survey Report (DSR) has been necessitated by Ministry of Environment, Forest and Climate Change (MoEF & CC) vide. their Notification No. 125 (Extraordinary, Part II Section 3, Sub-section ii), S.O. 141 (E), dated 15th January 2016. The notification was addressed to bring certain amendments with respect to the EIA notification 2006 and in order to have a better control over the legislation. District level committees have been introduced in the system. As a part of this notification, preparation of District Survey Reports has been introduced. Subsequently, Ministry of Environment, Forest and Climate Change has published Notification No. 3611 (E), dt. 25th July, 2018 regarding inclusion of the "Minerals Other than Sand" and format for preparation of the DSR has been specified. Enforcement &Monitoring Guidelines for Sand Mining (EMGSM) January 2020, Issued by Ministry of Environment, Forest and Climate Change is prepared in consideration of various orders/directions issued by Hon'ble NGT in matters pertaining to illegal sand mining and also based on the reports submitted by expert committees and investigation teams.

District Survey Report of River Bed Sand Mining in the Sahibganj district is prepared under;

- MoEF & CC, GoI notification S.O. 141 (E) dated 15/01/2016
- Sustainable Sand Mining Guidelines, 2016
- Sand Policy of Govt. of Jharkhand, 2017
- MoEF & CC, GoI notification S.O. 3611 (E) dated 25/07/2018
- Enforcement and Monitoring Guidelines for Sand Mining 2020
- Jharkhand Minor Mineral Concession (Amendment) Rules 2020.

The DSR of Sahibganj District also describes the general geographical profile of the district, distribution of natural resources, livelihood, climatic condition and sources of revenue generation.

2 Introduction

The District Survey Report of Sahibganj District has been prepared as per the guide line of Ministry of Environment, Forests & Climate Change (MoEF & CC), Government of India vide. Notification S.O.-1533(E) dated 14th Sept, 2006 and subsequent MoEF & CC Notification S.O. 141(E) dated 15th Jan, 2016. This report shall guide systematic and scientific utilization of natural resources, so that present and future generation may be benefitted at large. Further, MoEF & CC published a notification S.O. 3611(E) Dated 25th July, 2018 and recommended the format for District Survey Report.

The main objective of DSR is to identify the areas of aggradations or deposition where mining can be allowed; and identification of areas of erosion and proximity to infrastructural structures and installations where mining should be prohibited and estimation of annual rate of replenishment and allowing time for replenishment after mining in that area. The DSR would also help to calculate the annual rate of replenishment wherever applicable and allow time for replenishment. Besides the sand mining, the DSR also include the potential development scope of in-situ minor minerals.

The objectives of the District Survey Report are as following:

1. To identify and quantify minor mineral sand resources for its optimal utilization.
2. To regulate sand and gravel mining in the district Sahibganj, identification of site-specific end-use consumers and reduction in demand and supply gaps.
3. To facilitate use of Information Technology (IT) for surveillance of the sand mining at each step.
4. To enable environmental clearance for cluster of sand and gravel mines.
5. To restrict illegal mining.
6. To reduce occurrences of flood in the area.
7. To maintain the aquatic habitats.
8. To protect ground water in the area by limiting extraction of material in riverbeds to an elevation above the base flow.
9. To maintain data records viz. details of mineral resource, potential area, lease, approved mining plan, co-ordinates of lease hold areas, and revenue generation.
10. To design a scientific mining plan and estimate ultimate pit limit.

To frame a comprehensive guideline for mining of sand and other minor minerals.

The District Survey report (DSR) comprises of primary field dada as well as secondary data published and endorsed by various departments and websites about geology of the area, mineral resources, climate, topography, land form, forest, rivers, soil, agriculture, road, transportation, irrigation etc. Data on lease and mining activities in the district, revenue etc. is collected and collated from concern district Head Quarter.

The Deputy Commissioner though its letter 494/M, dated 09.05.2023, had constituted a Sub-Divisional Committee to verified the District Survey Report prepared by Environmental Consultant. List of the members of the Sub-Divisional Committee is as follows: -

अनुमंडल पदाधिकारी , साहेबगंज।

जिला खनन पदाधिकारी , साहेबगंज।

कार्यपालक अभियंता , लघु सिंचाई प्रमंडल , साहेबगंज।

राज्य प्रदूषण पार्षद द्वारा नामित पदाधिकारी।

वन प्रमंडल पदाधिकारी , साहेबगंज के नामित पदाधिकारी।

2.1 Statutory Framework:

a. Evolution of the Environmental Regulatory Framework:

Requirement of District Survey Report & its year wise modification of Guidelines is furnished in Table No 2.1.

Table 2-1 : Requirement of District Survey Report & its year wise modification of Guidelines

Year	Particulars
1994	The Ministry of Environment, Forest & Climate Change (MoEF&CC) published Environmental Impact Assessment Notification 1994 which is only applicable for the Major Minerals more than 5 ha.
2006	In order to cover the minor minerals also into the preview of EIA, the MoEF&CC issued EIA Notification SO 1533 (E), dated 14th September 2006, made mandatory to obtain environmental clearance for both Major & Minor Mineral more than 5 Ha.
2012	Further, Hon'ble Supreme Court wide order dated the 27th February, 2012 in I.A. No.12- 13 of 2011 in Special Leave Petition (C) No.19628-19629 of 2009, in the matter of Deepak Kumar etc. Vs. State of Haryana and Others etc.,

Year	Particulars
	ordered that "leases of minor minerals including their renewal for an area of less than five hectares be granted by the States/Union Territories only after getting environmental clearance from MoEF"; and Hon'ble National Green Tribunal, order dated the 13th January, 2015 in the matter regarding sand mining has directed for making a policy on environmental clearance for mining leases in cluster for minor Minerals.
2016	The MoEF & CC in compliance of above Hon'ble Supreme Court's and NGT'S order has prepared "Sustainable Sand Mining Guidelines (SSMG), 2016" in consultation with State governments, detailing the provisions on environmental clearance (EC) for cluster, creation of District Environment Impact Assessment Authority, preparation of District survey report and proper monitoring of minor mineral. There by issued Notification dated 15.01.2016 for making certain amendments in the EIA Notification, 2006, and made mandatory to obtain EC for all minor minerals. Provisions have been made for the preparation of District survey report (DSR) of River bed mining and other minor minerals.
2017	Jharkhand Minerals (Concession, Prevention of Illegal Mining, Transportation and Storage) Rules, 2017. The notification stated about the prevention of Illegal mining, transportation and storage of sand and guidelines for mining activity, safety barriers, mining depth and lease. The main objective of Jharkhand State Sand Mining Policy, 2017 to ensure that sand mining is done in an environmentally sustainable and socially responsible manner, Preparation of District Survey Report, and to ensure Categorization of Streams/Rivers, Management of Sand Deposition.
2018	MoEF & CC published a notification S.O. 3611(E) Dated 25th July, 2018 and recommended the format for District Survey Report. The notification stated about the objective of DSR i.e. "Identification of areas of aggradations or deposition where mining can be allowed; and identification of areas of erosion and proximity to infrastructural structures and installations where mining should be prohibited and calculation of annual rate of

Year	Particulars
	replenishment and allowing time for replenishment after mining in that area".
2020	Enforcement & Monitoring Guidelines for Sand Mining (EMGSM) 2020 has been published modifying Sustainable Sand Mining Guidelines, 2016 by MoEF & CC for effective enforcement of regulatory provisions and their monitoring. The EMGSM 2020 directed the states to carry out river audits, put detailed survey reports of all mining areas online and in the public domain, conduct replenishment studies of river beds, constantly monitor mining with drones, aerial surveys, ground surveys and set up dedicated task forces at district levels. The guidelines also push for online sales and purchase of sand and other riverbed materials to make the process transparent. They propose night surveillance of mining activity through night-vision drones.

2.2 Methodology of DSR Preparation

The steps followed during the preparation of District Survey Report are given in Figure 2.1. The individual steps are discussed in following paragraphs.

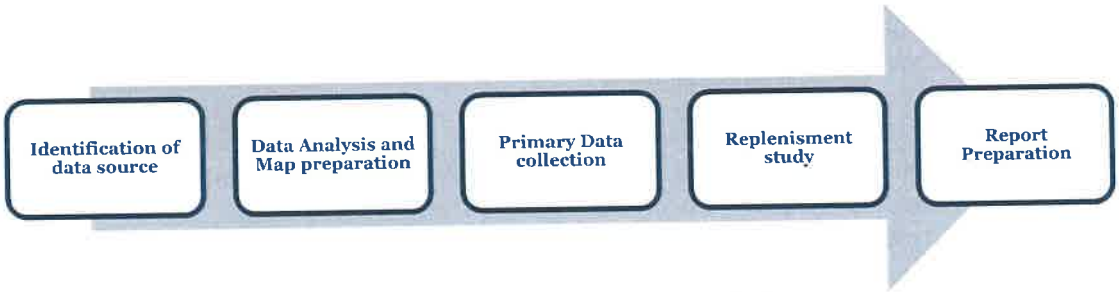

Figure 2-1 : Steps followed in preparation of DSR

2.2.1 Data source Identification:

District Survey Report has been prepared based on the Primary data base and secondary data base collected from different sources. The secondary data sources which are used in DSR are mostly Government published data based on the published report in reputed journal. District profile has been prepared based on the District Statistical handbook published by Jharkhand Government as well as District Census 2011. Mining lease details and the revenue generated from sand has been prepared based on available data from DMO, Sahibganj. Satellite imagery as well as field data

has been used for map preparation related to physiography and land utilization pattern of the district.

2.2.2 Data Analysis and Map preparation:

Dataset which are captured during the report preparation, are gone through detailed analysis work. District Survey Report involves the analytical implication of captured dataset to prepare relevant maps. Methodology adopted for preparation of relevant maps is explained below.

Land Use and Land Cover Map: Land Use and Land Cover classification is a complex process and requires consideration of many factors. The major steps of image classification may include determination of a suitable classification system via Visual Image Interpretation, selection of training samples, Satellite image (FCC-False Colour Composite) pre-processing, selection of suitable classification approaches, post-classification processing, and accuracy assessment.

Here LISS-III satellite Imagery has been taken for Supervised Classification as supervised classification can be much more accurate than unsupervised classification, but depends heavily on the training sites, the skill of the individual processing the image, and the spectral distinctness of the classes in broader scale.

According to the Visual Image Interpretation (Tone, Texture, Colour etc.) training set of the pixel has been taken.

	Agricultural Land - Based on their Geometrical shape, Red and Pink colour tone, Agricultural Land has been identified.	**Vegetation Covered Area** - Based on their continuous Red colour tone, Vegetation Covered Area has been identified.
	
Agricultural Fallow Land - Based on their Geometrical shape, Light and dark cyan with light pink colour tone, Agricultural Land has been identified.	**Bad Land Topography**- Light Yellowish mixed with cyan colour has been identified as Bad Land Topography.

	
Settlement – Area with Cyan Colour including geometrical shape has been recognised as Settlement Area.	**Water Bodies** – Dark blue colour has been classified as Water Bodies.

Figure 2-2 : Pictorial description of Land Use Classification methods

Geomorphological Map:

The major steps of preparing Geomorphological Map is identifying features like – Alluvial Fan, Alluvial Plain, Hilly Region etc. from Satellite Imagery (FCC-False Colour Composite) via Visual Image Interpretation and then digitization has been taken into the consideration to prepare map including all the Geomorphological features according to their location.

	
Alluvial Plain- In satellite Imagery the flat land has been identified as Alluvial Plain just below the Alluvial Fan.	**Alluvial Fan** – A fan-based deposition formed by stream where the velocity is abruptly decreased. In satellite Imagery this has been identified just below the hilly region.

Figure 2-3 : Pictorial description of Geomorphological Units Classification methods

Physiographical Map:

The major step of preparing Physiographical Map is generating contour at a specific interval to show the elevation of the area using Cartosat DEM.

Block Map:

- Raw Data collected from **National Informatics Centre (NIC Website).**
- Data has been geo-referenced using GIS software.
- Digitization of block boundary, district boundary, state boundary and district headquarter, sub –district headquarter, places, road, railway, river, nala etc.

- Road name, River name, Railway name has been filled in attribute table of the Layers
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Transportation Map:

- Raw Data collected from **National Informatics Centre (NIC Website).**
- Data has been geo-referenced using GIS software.
- Digitization of block boundary, district boundary, state boundary and district headquarter, sub –district headquarter, places, road, railway, river, nala etc.
- Road name, River name, Railway name has been filled in attribute table of the Layers
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Drainage Map:

- Raw Data collected from **National Informatics Centre (NIC Website).**
- Data has been geo-referenced using GIS software.
- Digitization of block boundary, district boundary, state boundary and district headquarter, sub –district headquarter, places, road, railway, river, nala etc.
- Road name, River name, Railway name has been filled in attribute table of the Layers
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Seismic Map:

- Raw data collected from **Ministry of Earth Science.**
- Data has been geo-referenced using GIS software.
- Digitization of Earthquake zone and superimposed it over Block Boundary.
- Zone name has been filled in attribute table of the Layers
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Soil Map:

- Raw data collected from **National Bureau of Soil Survey and Land Use Planning.**
- Data has been geo-referenced using GIS software.
- Digitization of Soil classification zone and superimposed it over District Boundary.
- Soil classification has been filled in attribute table of the Layers.
- Final layout has been prepared by giving scale, legend, north arrow, etc.

Wildlife Sanctuary and National Park Location Map:

- Raw data collected from **ENVIS Centre on Wildlife & Protected Areas.**
- Data has been geo-referenced using GIS software.
- Digitization of Wildlife Sanctuary & National Park and superimposed it over Block Boundary.

- Wildlife Sanctuary & National Park name has been filled in attribute table of the Layers.
- Final layout has been prepared by giving scale, legend, north arrow, etc.

2.2.3 Primary Data Collection:

To prepare DSR, capturing primary data or field data has also been carried out in the district. Field study involves assessment of the mineral resources of the district by means of river cross- section studies in specific interval. This provides clear picture of mineral matters characterization and their distribution over the area. Pre-monsoon data provided by DMO Sahibhanj.

2.2.4 Report Preparation:

The district survey report portrays general profile, geomorphology, land use pattern and geology of the district. The report then describes the availability and distribution of riverbed sands and other minor minerals in the district. Apart from delineation the potential mining blocks, the report also includes inventorization of the minerals, recent trends of production of minor minerals and revenue generation there from. Annual replenishment of the riverbed sand has been estimated using field observation, satellite imagery and empirical formula. The road network connecting arterial road to potential mining blocks has been identified. Potential environmental impacts of mining of these minerals, their mitigation measures along with risk assessment and disaster management plan have also been discussed. Finally, the reclamation strategy for already mined out areas is also chalked out.

2.3 Demand and Supply of Sand

Sand is a multi-purpose topographical material. It is known as one of the three fundamental ingredients in concrete. The composition of sand is diverse.

The robustness of sand has played a significant role in everyday life. We use sand practically every other day.

Sand extraction from river beds are the main mining activities in the district. With a spurt in construction of real estate sectors and various govt. sponsored projects, the demand for sand has increased manifold.

In the real world, there are a lot of situations where we can find uses/demand of sand. Followings are the common sand uses.

1. While bunging metal, we can mix sand with clay binder for frameworks used in the foundries.
2. Sand can be used for cleaning up oil leak or any spill by dredging sand on that spill. The material will form clumps by soaking up, and we can quickly clean the mess.
3. Sand can be used as a road base which is a protective layer underneath all roads
4. Industrial sand is used to make glass, as foundry sand and as abrasive sand.

5. One creative usage of sand is serving as a candle holder. We can try putting some sand before pouring tea light or any candle in a glass. It holds the candle still and refrain the candle from rolling by giving it an excellent decoration.
6. Adds texture and aesthetic appeal to space.
7. Sand is mostly pure to handle, promptly available and economically wise.
8. We use sand in aquariums, fabricating artificial fringing reefs, and in human-made beaches
9. Sandy soils are ideal for growing crops, fruits and vegetables like watermelon, peaches, peanuts, etc.
10. Sand can light a path by filling mason jars with sand and tea light which is another inexpensive way to make a walkway glow.
11. Sand helps to improve resistance (and thus traffic safety) in icy or snowy conditions.
12. We need sand in the beaches where tides, storms or any form of preconceived changes to the shoreline crumble the first sand.
13. Sand containing silica is used for making glass in the automobile and food industry-even household products for the kitchen.
14. Sand is a strong strand which is used for plaster, mortar, concrete, and asphalt.

Sand extracted from Sahibganj district is used extensively in construction works ranging from individuals to organized corporate and government sectors.

3 General Profile of the district

3.1 General Information

The district Sahibganj is situated in the north – eastern part of the Jharkhand state. It is bounded in the north by a small portion of Bhagalpur and Kathihar districts of Bihar state, in the east by West Bengal, in the south by Pakur district and in the west by Godda district and a portion of Bhagalpur district (Bihar). The district is situated between 24° 43' 00"and 25° 50' 45" North latitude and 87°27' 30" and 87° 58' 15" East longitude. The district covers Survey of India toposheets nos. 72 O/ 7, 72 O/ 8, 72 O/ 11, 72 O/ 12, 72 O/ 16, 72 P/5, 72 P/ 9, 72 P/10, 72 P/13 and 72 P/14.

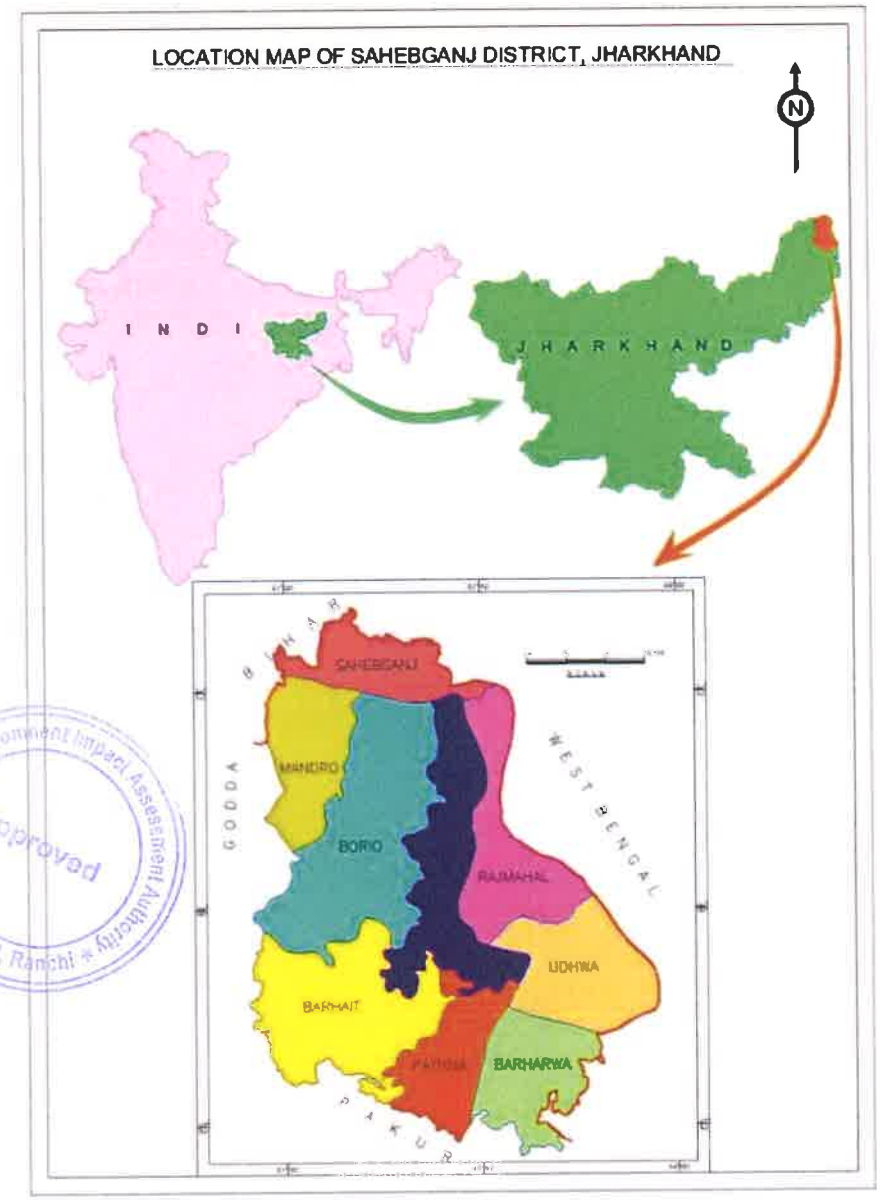

Figure 3-1 : Location map of Sahibganj district, Jharkhand

3.2 Administrative Setup of District

The district has two sub divisions i.e., Sahibganj and Rajmahal and nine blocks namely – Sahibganj, Borio, Taljhari, Rajmahal, Barharwa, Pathna, Barhait, Mandro and Udhwa. The total number of villages in the district is 1813, of these 1349 are inhabited and 464 uninhabited.

The district administration is headed by the Deputy Commissioner. He belongs to I.A.S. cadre. He also acts as the Collector in case of Revenue matters, as District Development Commissioner in case of District Developmental works, as District Magistrate in case of maintenance of Law and Order and General Administration, as District Election Officer in case of conduct of Election. He is assisted by a lot of officers mostly belonging to officials of Jharkhand Public Service Commission. Police Administration is looked after by the superintendent of the police (S.P.). He is also assisted by no. of officers like Assistant Superintendents of Police, Deputy Superintendent of Police, Inspector of Police, etc.

A Block map of Sahibganj District is furnished as Figure No.3.2.

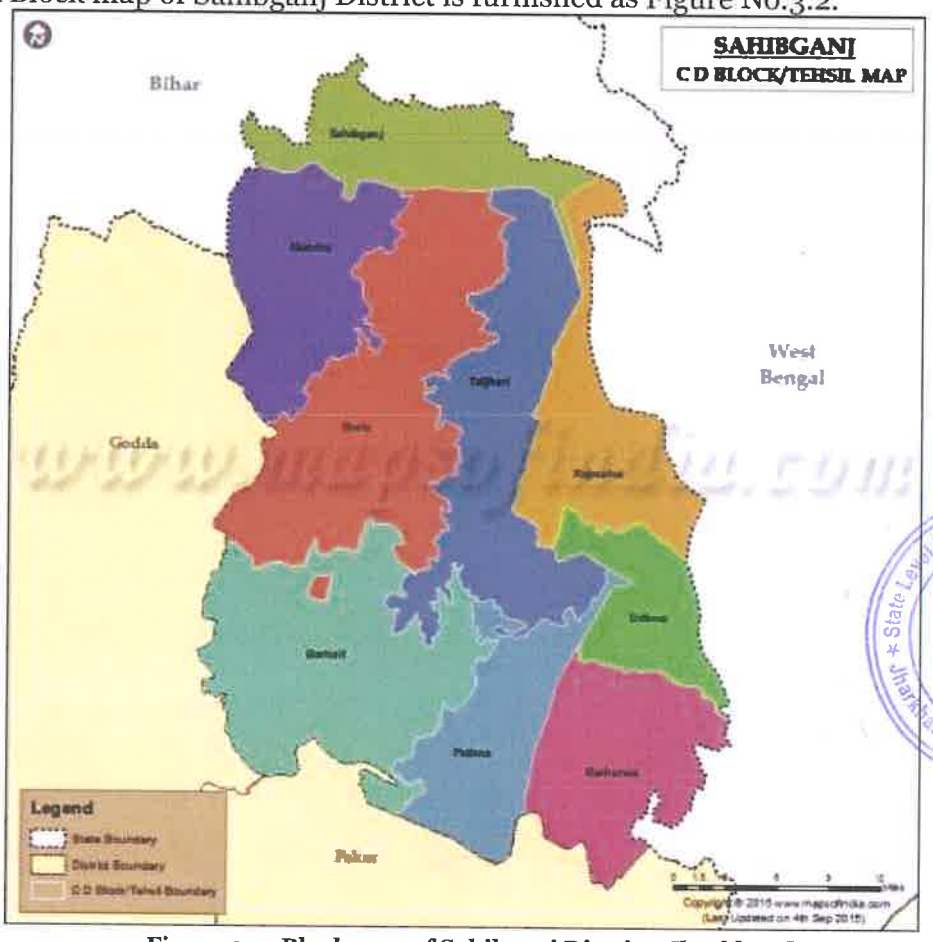

Figure 3-2: Block map of Sahibganj District, Jharkhand
(Source: https://www.mapsofindia.com/maps/jharkhand/tehsil/sahibganj.html)

Detail of Blocks of Sahibganj District is furnished in Table No.3.1.

Table 3-1 : Details of Block of Sahibganj District

Sl. No.	Block Name	Area in sq.km.
1	Sahibganj	168.16
2	Borio	391.76
3	Taljhari	273.03
4	Rajmahal	140.76
5	Barharwa	187.33
6	Pathna	171.39
7	Barhait	370.98
8	Mandro	182.24
9	Udhwa	214.83

(Source: District Census Handbook, Sahibganj)

3.2.1 Climate Condition

The district is characterized by humid to sub-humid climate. During summer the hot spell prevails from March to middle of June. Rainy season started from middle of June to end to September. Winter starts from the middle of November and continues till the end of February. The district experiences great heat from March to May, when the maximum temperature reaches up to 44.4°c. December being the coldest month when the minimum temperatures fall down up to 6.8°c.

The area receives rainfall by South-West monsoon. Rainy season sets in the middle of June and lasts till September. The normal average rainfall) in the district is 1575 mm.

The rainfall of the district is given below in Table No.3.2.

Table 3-2 : Details of rainfall data of 20 years (from 2001 to 2020)

Year/Month	Jan.	Feb.	March	Aprill	May	June	July	Agu.	Sept.	Oct.	Nov.	Dec.	Total

3.2.2 Demography

According to the 2011 census, Sahibganj district has a population of 1,150,567 with which 589,391 male population and 561,176 female population. There are 464 uninhabited villages (out of 1,813 total villages) in the district of Sahibganj. In terms of population per sq.km. Sahibganj is the 8rd densely populated district in the state with 588 persons per sq.km as against the state's 414. Sahibganj has a sex ratio of 933 females for every 1000 males, and a literacy rate of 66.41%. The district headquarter is Sahibganj. Sahibganj has a sex ratio of 952 females for every 1000 males, and district has population of literate's 483263 with which 287303 males population and 195960 female population.

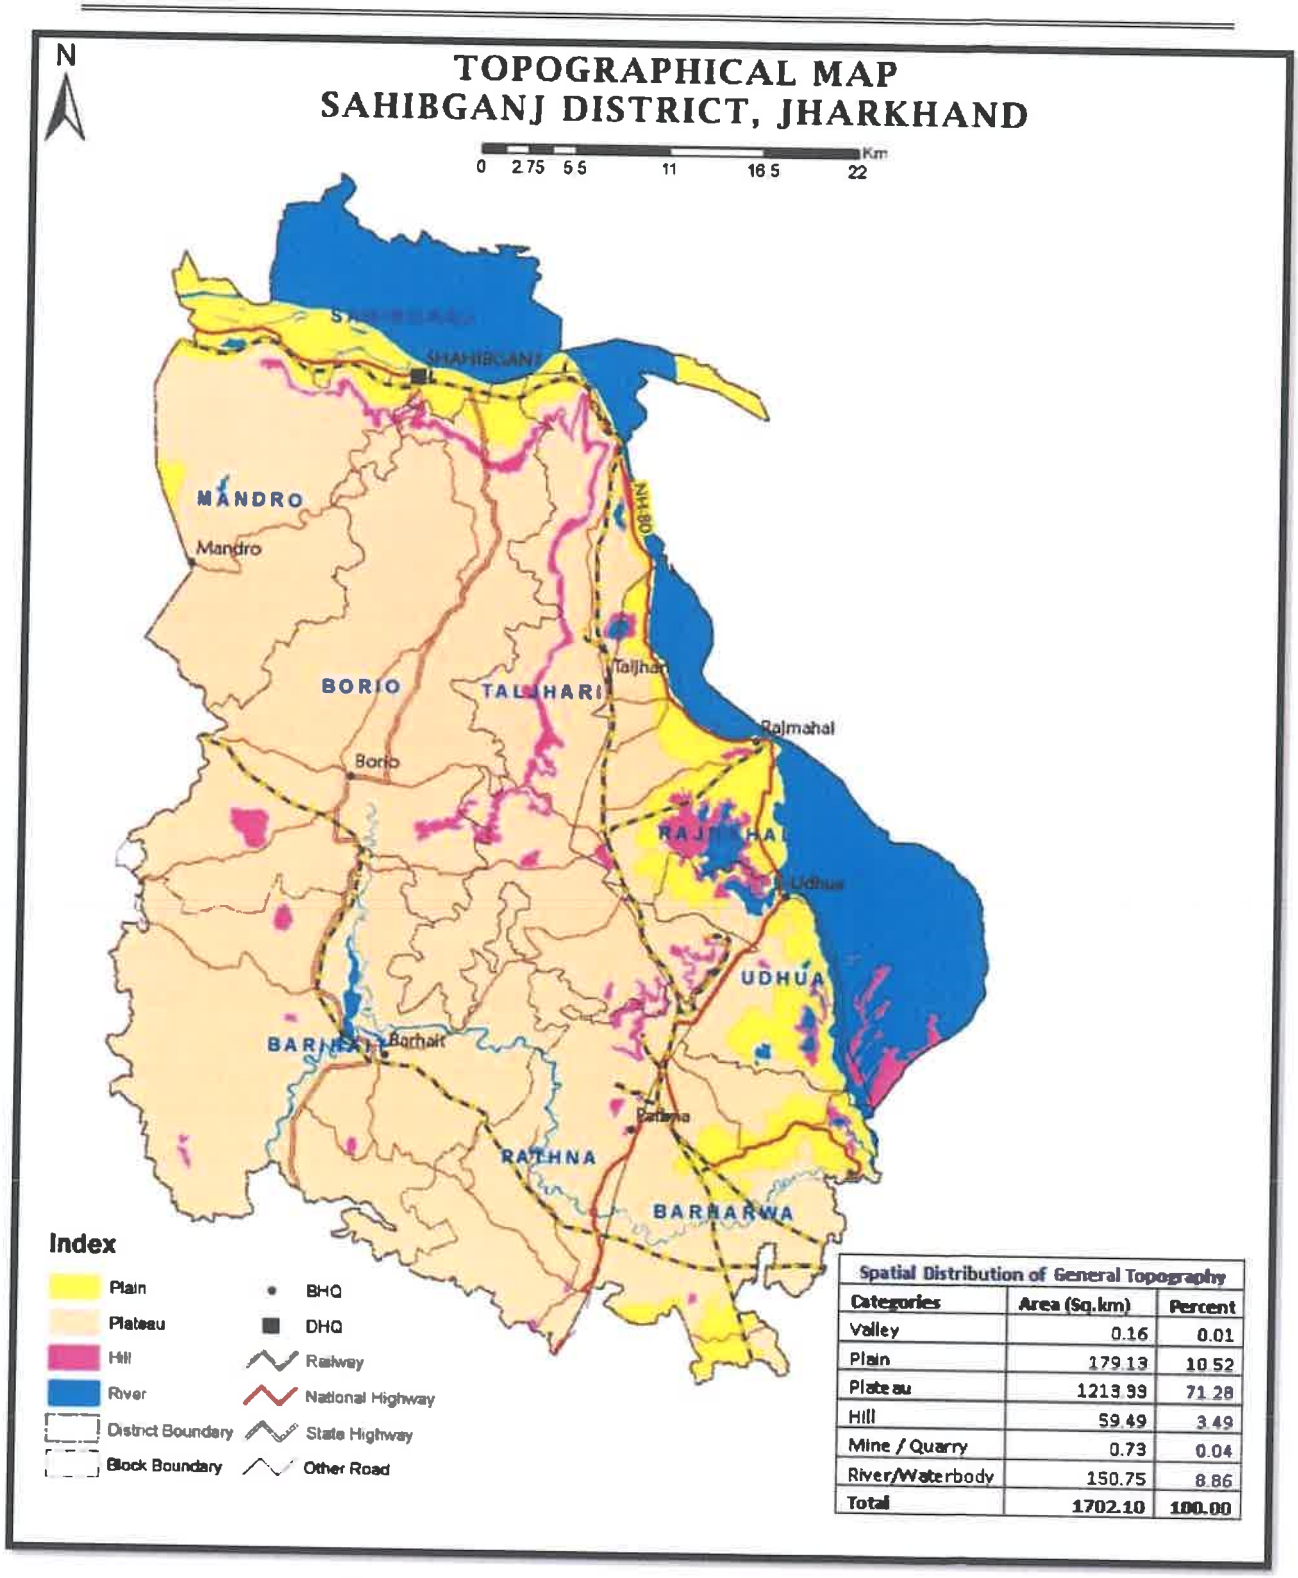
3.2.3 Cropping pattern

The major crops cultivated in the area are paddy, wheat, maize, gram, oil seeds, pulses and vegetable. The paddy is grown in all the three cropping season viz., Aghani, Bhadai and summer. Summer paddy is mainly cultivated in the low lying area along the river course where water is available for sufficient irrigation. But the land available for cultivation is very limited because of the hilly and rugged topography.

3.2.4 Topography & Terrain

A large part of the district is hilly. The vast tract of land enclosed between hill ranges had been assigned a name- Damin-I-koh, which is a Persian word means Skirts of the hills. The region on the bank of the Ganges is fertile and richly cultivated. The district may be divided into two natural divisions on the basis of its geographical location and cultivable land. First region consists of Borio, Mandro, Barhait, Pathna and Taljhari blocks and lies under Damin-I-koh area. The hills and slopes are covered with forests, once dense but scanty now. The valleys have cultivable lands, yielding mostly paddy. The inhabitants of this region are generally Paharias, Mal Paharias and Santhals. The inhabitants on the hill top cultivate Barbatti and maize using rain water.

The second region consists of Sahibganj, Rajmahal, Udhwa and Barharwa blocks. This plain region consists of the uplands, undulation along ridges and depressions. The Ganges, Gumani and Bansloi rivers flow through this region. This area has plenty of fertile lands and is richly cultivated. The inhabitants of this region are mainly middle class people of different castes, Paharias and Santhals.



Spatial Distribution of General Topography		
Categories	Area (Sq.km)	Percent
Valley	0.16	0.01
Plain	179.13	10.52
Plateau	1213.99	71.28
Hill	59.49	3.49
Mine / Quarry	0.73	0.04
River/Waterbody	150.75	8.86
Total	1702.10	100.00

(source: https://jsac.jharkhand.gov.in/district_profile/Sahibganj.pdf)

3.2.5 Hydrogeology

The occurrence and movement of ground water in the area is variable, which is broadly governed by geological frameworks i.e., nature of rock formations including their porosity (primary and secondary) and permeability. The principal aquifer in the area is Basalt, where the occurrence and movement of ground water primarily depends on the degree of interconnection of secondary pores/voids developed by fracturing and weathering. Rajmahal Traps in the area constitutes number of basaltic flows separated by intertrappeans beds which are often agillaceous and arenacious in nature. The intertrappeans beds separates two flows occurs as impermeable beds. The distinctive hydrogeological features of the basaltic rocks are the significant primary porosity in the form of vesicles, cracks etc. The secondary porosity is developed due to fracturing during cooling of lavas, tectonic disturbances, weathering etc. Laterites are mainly of insitu origin and have formed by subaerial erosion of underlying basalts under favourable climatic condition. The study 22 reveals that vesicular basalts, laterites, intertrappeans formation etc form suitable condition for ground water storage. The alluvium occurs in the northern and eastern boundary of the district, which is composed mainly of sand and sub ordinate clay. Younger alluvium (up to 70 m) is most productive rather than older alluvium.

DEPTH TO WATER LEVEL: Water level scenario of shallow aquifer was generated by utilizing water level data of 27 monitoring wells representing shallow aquifer. The pre monsoon (May 2016) depth to water monitored between 2.84 to 11.51 mbgl. The post monsoon depth to water level (Nov. 2016) in the dug wells ranges from 1.48 to 7.50 mbgl. During 2017, the water level of shallow aquifer was monitored between 2.58 to 11.15 and 1.14 to 6.51 mbgl for the period of pre and post monsoon respectively. Similarly, post monsoon water level was monitored for the year 2018 and it is observed the water level varies from 2.45 to 9.62 mbgl.

3.2.6 Ground Water Development:

There is sufficient scope for ground water development through shallow as wells deep bore wells. State Govt. department has been constructed a large number of bore wells to mitigate the drinking water problem in the district. Central Ground Water Board has drilled 8 exploratory wells 5 observation wells in the district. The depth of bore wells ranges between 44.20 – 200.00 mbgl. The yield of bore wells ranges from 1.08 to 30.00 m3/hr. The Transmissivity and Storativity value ranges from 32.30 to 176.00 m2/day and 01.40 x 10-4 to 07.30 x 10-5 respectively. The stage of ground water development of the district is only 22.44%.

General Range of Chemical Parameters of Aquifer – I & II: - Evaluation of ground water suitability in relation to its different purposes has been classified for drinking /domestic and irrigation. The variation ranges of the concentration in ppm of different chemical constituents and quality parameters of Aquifer I.

Chemical Constituents and quality parameters	**Aquifer – I (Dug well samples)**	**Aquifer – II (Hand pump sample)**
pH	7.42-8.43	7.11-8.46
EC (micro siemens/cm at 25^{0}c)	92-2400	131 - 1494
TDS (ppm)	60 - 1560	85 - 971
TH as CaCo3 (ppm)	90 - 1060	60 - 495
Ca (ppm)	10 - 304	6 - 114
Mg (ppm)	8.5 – 86.26	6.07 – 61.96
Na (ppm)	8 - 100	9.48 - 105
K (ppm)	0.29 – 10.01	0.23 – 6.28
HCO3 (ppm)	61.5 - 603	55.4 - 387
Cl (ppm)	10.63 - 460	7.09 - 252
SO4 (ppm)	9.96 – 126.74	13.35 - 112
NO3 (ppm)	0 – 34	0 – 24.63
F (ppm)	0.03 – 0.29	0 – 0.11

Classification of ground water of Aquifer – I & II based on EC

Sl. No.	Water Class	Rages of EC	No. of samples falling and their percentage	
			Aquifer - I	**Aquifer - II**
1	Excellent	< 250	01 (4%)	01 (4%)
2	Good	250 – 750	10 (44%)	18 (75%)
3	Permissible	750 – 2250	10 (44%)	05 (21%)
4	Unisuitable	>2250	02 (8%)	Nil

The ground water of Aquifer – I (shallow aquifers) in the area is alkaline in nature. On the above table, the pH value of the area is 7.42 – 8.43. The TDS value varies between 60 to 1560 mg/l. Overall values of Calcium and Magnesium varies between 10 to 304 mg/l and 8.5- 86.26 mg/l in the area respectively. Nitrate concentration is observed between 0 to 34 mg/l while the Fluoride value varies from 0 to 0.29 mg/l within the area.

The ground water of aquifer - II in the area is alkaline in nature. The pH value ranges 7.11 to 8.46 mg/l. The EC value ranges between 131 to 1494 mg/l. The TDS value varies from 85 to 971 mg/l and the total hardness ranges between 60 to 495 mg/l. Calcium and Magnesium values varies from 6 to 114 mg/l and 6.07 to 61.96 mg/l respectively.

Table 3-3 : Stage of ground water development of Sahibganj District as on 31st March 2009(Ha-m)

Sl. No	Assessment Unit/ District	Net Annual Ground Water Availability	Gross Ground Water Draft for Irrigation	Gross Ground Water Draft for Domestic and Industrial water Supply	Gross Ground Water Draft for all Uses (10+11)	Allocation for Domestic and Industrial Requirement supply upto next 25 years	Net Ground Water Availability for future irrigation development (9 – 12 – 13)	Stage of Ground Water Development (12/9)*100 (%)	Categorisation for future ground water development (safe/ critical/ over - exploited)
1	Sahibganj	2365.41	25.056	168.99	194.05	225.30	2115.06	8.20	Safe

(Source: Central Ground Water Board, Sahibganj)

a) Drainage System

The river Ganges forming the northern boundary of the district enters at its north western corner and journeys eastward up to Sakrigali where it takes a turn to the south and forms the southern boundary of the district up to a little beyond Radhanagar in Rajmahal subdivision. The river has been drifting gradually to the north and the Sahibganj town, which was once on the riverbank, is now about a mile away. The average width of the Ganges in the district is about 4 and half kilometers. It generally swells during the rains and inundates the lowlands lying east of the loop line. River Gamani emerges from the southern region of the Rajmahal hills. It flows in a north-easterly direction up to Barhait valley where it is joined by the river Mural. The drainage pattern of the district is dendritic. Drainage map of the district is shown in 3-7.

(source: https://jsac.jharkhand.gov.in/district_profile/Sahibganj.pdf)

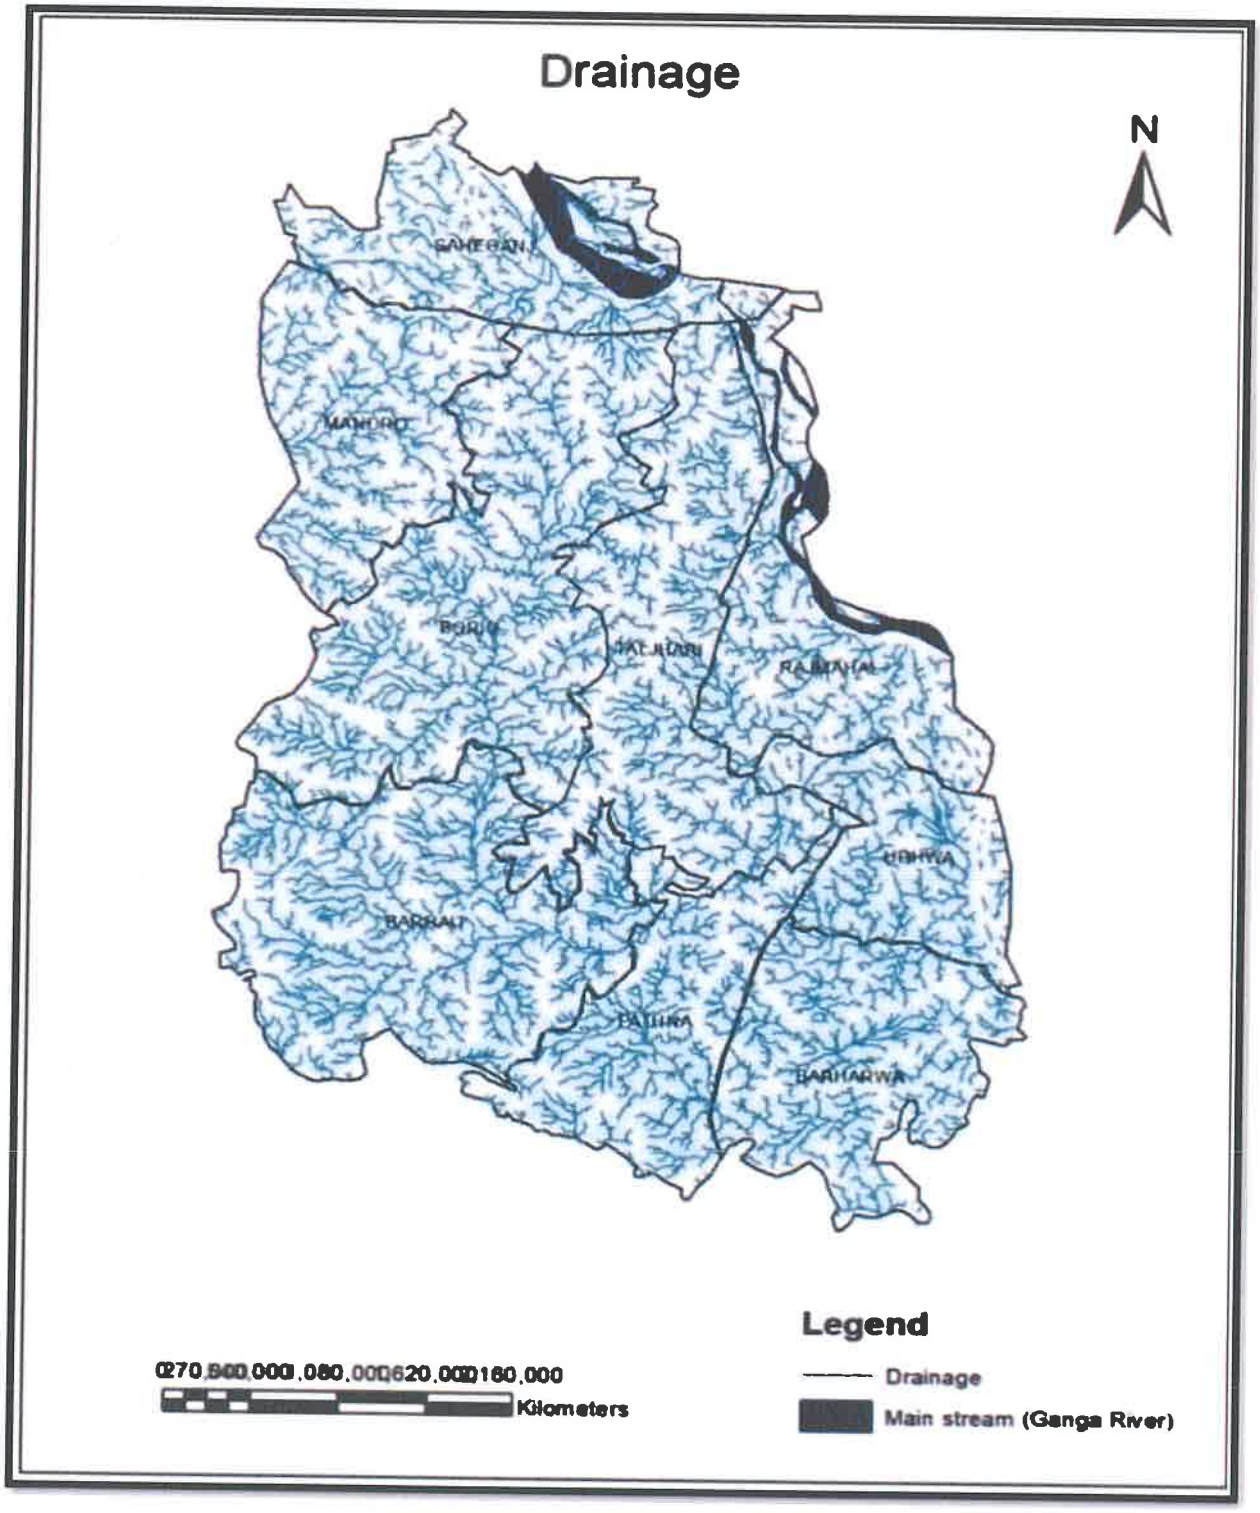

Figure 3-7 : Drainage map of Sahibganj district

(Source: http://cgwb.gov.in/AQM/NAQUIM_REPORT/Jharkhand/Final%20Sahibganj%20Report-NAQUIM-2017-18.pdf)

- **Floods in district Sahibganj:**

The area is mainly drained by the river Ganges, Gumani and Morang. The Ganga flowing along extreme northern to eastern part of the district is the perennial river. River Gumani flows west to east direction in southern part of the district while river Morang flows north to south direction in middle part of the district and finally joined by the river Gumani near village Barhait.. The Gumani and Morang are seasonal in nature. Ganga River is perennial river, which carry huge volumes of water during the rainy season. Town is located adjoining the river Ganga. The highest recorded flood level of river Ganga is 28.22 m.

(Source: District Environment Plan Sahibganj)

Distribution of the vulnerable and less vulnerable flood prone districts are shown in the below figure.

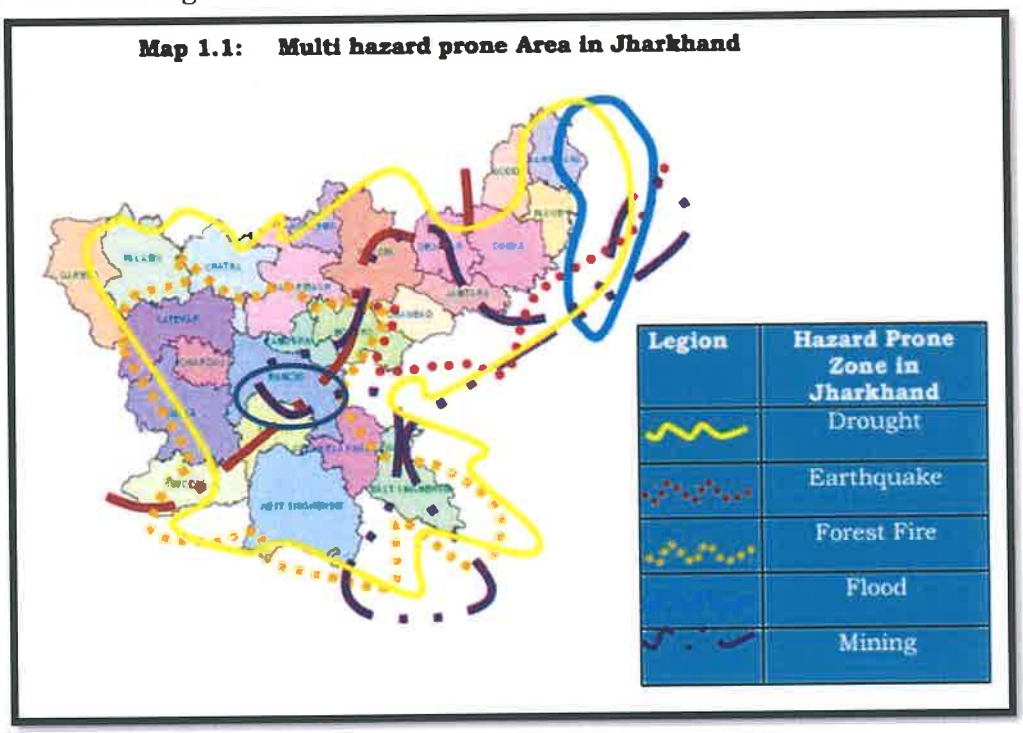

Figure 3-8 : Multi hazard prone area in Jharkhand

(Source: https://selfstudy365.com/qa/how-many-districts-of-jharkhand-come-under-the-earthquake-hazard-zone-fiedabao)

From the above information, it is being observed that, Sahibganj is flood prone district of Jharkhand.

b) Seismicity

As per Seismicity Zonation map, 3 types of Zones have been observed in Jharkhand. Sahibganj comes under India's seismic zone-IV.

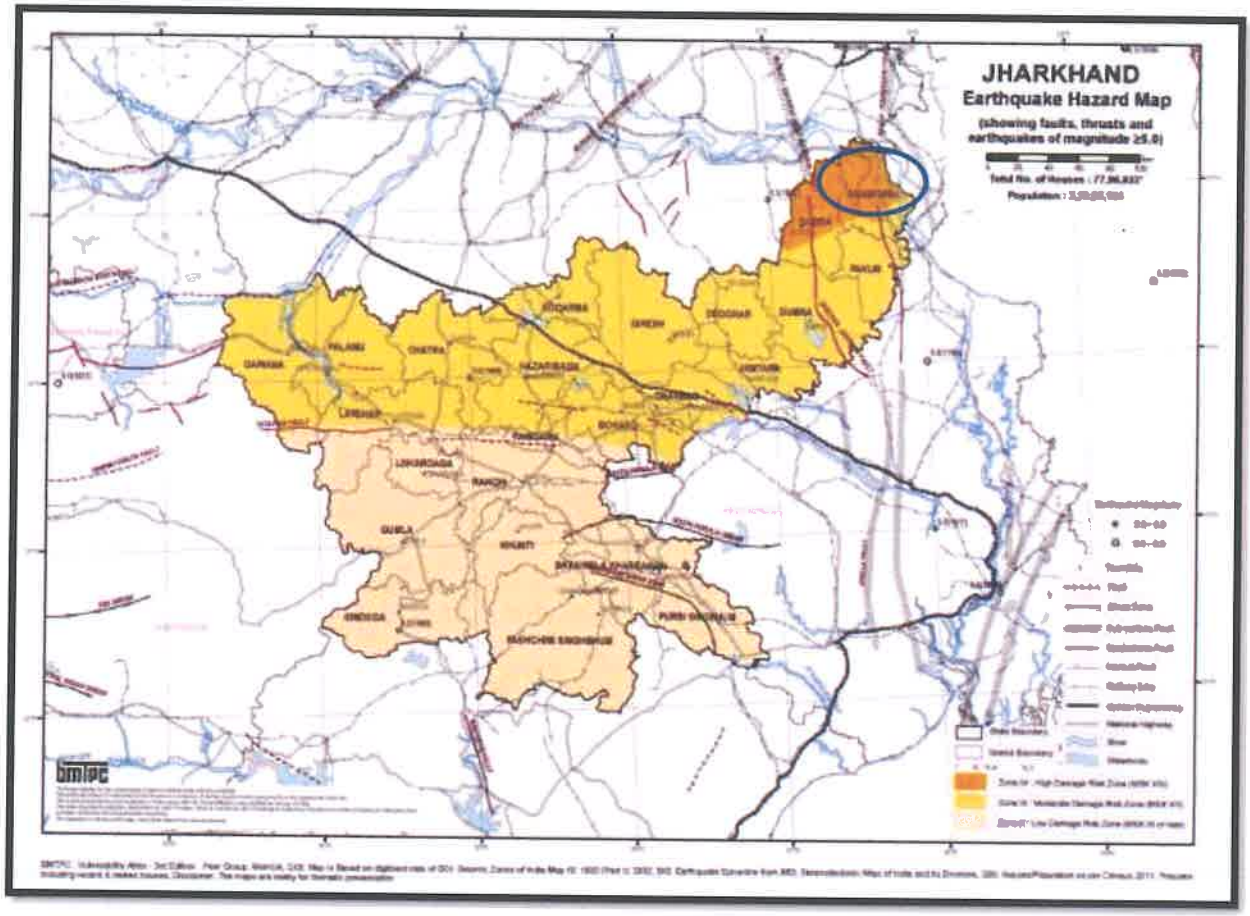

Figure 3-9 : Jharkhand Earthquake Map

(Source: https://bmtpc.org/DataFiles/CMS/file/VAI2019/eq-jh.html)

c) Flora

The most common tree found in the district is sal (Shorea Robusta). Some teak, though not of good quality, is also found. Some other trees found in the district are Jackfruit, Simal, Bamboo, Asan and Satsal. Sal and Simal logs and Jackfruit are exported in large quantities to the neighboring districts and also to the places outside Jharkhand.

d) Fauna

A map showing Wildlife Protect areas in Jharkhand state are furnished which depicts there is no Wildlife Protect area in Sahibganj District.

4 Physiography of the district

4.1.1 General Landforms

The area is characterized by undulating topography with hills and plain. Major part of the area is covered by basaltic terrain of Rajmahal hills which is bounded on the north and partly on the east by the Ganges. The western part of the area is bounded by the hills.

4.1.2 Soil and rock pattern

The area is characterized by the following type of soils –

(i) Rajmahal trap soil

(ii) Red soil

(iii) Eroded scarp soil

(iv) Foothill soils

(v) Tal soil

(vi) Alluvial soil.

Rajmahal trap soil: Soils derived from basaltic lava occurs in major part of the area. These soils, black in colour are very fertile and restricted to Rajmahal lava areas.

Red Soil: Red soils are light to medium and are red to yellow and light gray in colour. These soils are mildly acidic in reaction and low in organic constituent. Dry crops and paddy grow in these soils.

Eroded scarp soil: This type of soil occurs in transverse section of dissected, descending scarp land at various altitude of upland. This type of soil has poor fertility with shallow thickness.

Foothill soil: Foothill soils occur in the eastern fringe of the area. The soil is deep and acidic in reaction. The soil is yellowish red in colour crops like maize, arhar etc. grow in these soils.

Tal soil: Tal soil is found in the back water belt around Berharwa areas when the rain water remains collected in the rainy season. The soil is very fertile. Kharif crop is cultivated in these soils since the area remain submerged in rain water.

Alluvial soil: Alluvial soil occurs near Sahibganj plains. The texture is clayey loam type. Paddy, wheat, sugarcane grow in these soils.

5 Land use pattern of the district:

There is heterogeneity in the soils of the area. The soils of the district are light grey and fine textures in nature.

Land use pattern of Sahibganj district (2015– 2016)

Block	Total area (Sq. Km)	Forest land	Barren & non agricul-turable land	Cultiva-ble waste land	Permanent pastures & other grassing land	Land under miscella-neous trees	Current fallow	Fallow land other than current fallow	Net area sown
Sahebganj	173.27	--	1689.45	1794.68	0.87	23.42	4699.93	2243.29	3062.69
Borio	261.74	12336.27	1834.38	3439.01	1448.00	270.95	5763.64	6769.30	2663.81
Mandro	123.52	7892.23	375.33	398.74	292.63	88.09	6435.37	4281.97	2050.60
Barhait	308.82	4016.29	3623.08	2133.34	1396.08	1700.68	6464.55	8462.62	6786.80
Rajmahal	126.93	--	244.53	138.85	141.06	0.04	4040.04	2385.53	3391.19
Udhwa	199.13	--	127.67	47.16	25.97	115.37	4190.34	673.86	2674.29
Taljhari	158.28	2650.61	1726.35	1056.88	313.05	106.51	7600.10	4300.93	4333.54
Pathna	163.16	1112.49	1641.11	1014.17	585.21	392.60	996.66	3946.30	6323.15
Barharwa	187.25	--	47.31	74.33	386.47	87.59	1144.10	2794.03	13443.11
Total	1702.10	28007.89	11309.21	10097.16	4589.34	3085.25	41334.73	35857.83	44729.18

(Source: http://cgwb.gov.in/AQM/NAQUIM_REPORT/Jharkhand/Final%20Sahibganj%20Report-NAQUIM-2017-18.pdf)

A) Forest detail of the area

Owing to large scale unscrupulous felling the region once known for its thick and extensive forests is now bereft of much of its jungle wealth. The Forest department has undertaken afforestation of these areas.The most common tree found in the district is sal (Shorea Robusta).Some teak, though not of good quality, is also found. Some other trees found in the district are Jackfruit, Simal, Bamboo, Asan and Satsal. Sal and Simal logs and Jackfruit are exported in large quantities to the neighboring districts and also to the places outside Jharkhand.

b) Agriculture& Irrigation

The local population of the district mostly depends on agriculture and forestry for their sustenance. The agriculture activity of the area is solely dependent upon the monsoon rainfall. Paddy is the main crop of the district. Gram and Khesari are other crops grown widely in Rajmahal and its adjoining areas. Irrigational facilities

are not adequate in this district. The most common source is the dug well, but this is not a very dependable source of irrigation. The major part of the district being rocky in nature, it is difficult to dig wells. The undulating nature of land makes it possible to store rain water by bunding. Apart from being dependent upon rains, these are by no means adequate. The result is that failure of rains invariably involves failure of crops except in small pockets. Minor irrigation structures like surface water tanks and ponds are the other source for irrigation.

c) Mining

The Rajmahal Hills are the source of building and road stones. Most of the quarrying is done by the side of the loop line of the Eastern Railway. Pakur chips are quite well known and are used extensively all over Jharkhand, Bihar and parts of West Bengal. Kaolin is found near Mangal Hat in Rajmahal subdivision. Bentonite available in some places is used by women-folk as hair washing material and now a day it is getting popular among urban ladies as Multani Mitti.
Available mineral resources in the district is given below:

- BLACK STONE
- KAOLINE
- COAL
- CHINA CLAY
- BENTONITE

Sand mining activities are playing a significant role industrial, social and economic development of the district. The sand mining carried out throughout the district mainly in stretch of Ganga & Gumani river etc.

6 Geology

Geologically major part of the area is represented by Rajmahal traps having huge thickness of basaltic lava flows with intercalated shales and Clays. The type area is the Rajmahal hills at the head of the Ganges delta near the border of Jharkhand and west Bengal. Tha Rajmahal ranges extend with a north-south trend for more than 120 kms through the districts of Santhal Parganas in Jharkhand and Birnbaum in West Bengal (GSI, 1989). It consists of long flat topped hills attaining a maximum altitude of about 600 m. The basaltic lava flows of the Rajmahal Trap of middle Jurassic to lower cretaceous age occupy the major part of the district. It has been found that there are at least seven successive flows of basalt in the area, each flow ranging in thickness between 20m and 75 m. Rajmahal Traps are undererlain by Gonwana formations. Rajmahal Traps are overlain by Laterites and Alluvium. The river Ganga deposit recent alluvium occurs in the northern to eastern boundary of the area. The alluvium comprising of sand, silt, gravel and sub – ordinate clay. Laterites are mainly in situ origin and have been formed by sub – aerial erosion of underlying basalt under favorable climatic conditions. The stratigraphic sequence of the area is as under.

	Age	Formation
	Recent	Alluvium
	Cenozoic	Laterite
Upper Gondwana	Middle Jurassic to Lower Cretaceous	Rajmahal Trap with intertrappeans
	..... Igneous Contact	
	Lower Triassic to lower Jurassic	Dubrajpur Formation
Lower Gondwana	.....Unconformity and overlap	
	Upper Permian	Barakar Formation
	Lower Permian	Talchir Formation
	..... Unconformity.....	
	Precambrians	Metamorphics (Granite-Gniess, etc.)

(Source: http://cgwb.gov.in/AQM/NAQUIM_REPORT/Jharkhand/Final%20Sahibganj%20Report-NAQUIM-2017-18.pdf)

(Source: https://geology.jharkhand.gov.in/documents/geological_map/Sahibganj.pdf)

7 Mineral wealth

The Rajmahal Hills are the source of building and road stones. Most of the quarrying is done by the side of the loop line of the Eastern Railway. Pakur chips are quite well known and are used extensively all over Jharkhand, Bihar and parts of West Bengal. Kaolin is found near Mangal Hat in Rajmahal subdivision. Bentonite available in some places is used by women-folk as hair washing material and now a day it is getting popular among urban ladies as Multani Mitti.

Available minor mineral resources in the district are:

- Sand
- Black Stone
- Kaoline
- Coal
- China Clay
- Bentonite

Sand mining activities are playing a significant role industrial, social and economic development of the district. The sand mining carried out throughout the district mainly in stretch of Gumani river.

7.1 Overview of mineral resources

The mineral resources of the district whose categorization and estimation have been done are furnished in this section.

7.2 Details of Resources

A) Sand and other riverbed minerals:

i) Drainage System

The river Ganges forming the northern boundary of the district enters at its north western corner and journeys eastward up to Sakrigali where it takes a turn to the south and forms the southern boundary of the district up to a little beyond Radhanagar in Rajmahal subdivision. The river has been drifting gradually to the north and the Sahibganj town, which was once on the riverbank, is now about a mile away. The average width of the Ganges in the district is about 4 and half kilometers. It generally swells during the rains and inundates the lowlands lying east of the loop line. River Gamani emerges from the southern region of the Rajmahal hills. It flows in a north-easterly direction up to Barhait valley where it is joined by the river Mural.

The district is drained by these rivers with a few minor tributaries. The Ganga and Gumani River are having I, II and III order of tributaries.

All these tributaries show dendritic to sub-dendritic drainage pattern typical of granitic terrain. The rivers of the district show structurally controlled pattern. The drainage here is highly dissected in crisscross fashion. The general trend of the drainage is from NW to SE.

Table 7-1: Drainage System with description of Main River

S. No.	Name of the River	Area drained (Sq. Km)	% Area drained in the district
1	Ganga River	1048.227	38%
2	Gumani River	994.561	6%

Table 7-2:- Salient Features of Important River & Stream

S. No.	Name of the River or Stream	Total Length in the District (in km)	Place of Origin	Altitude at Origin
1	Ganga River	40	Gangotri glacier in the Himalayas	7,010 m
2	Gumani River	44	Sundar Pahari	456 m

ii) Annual deposition of riverbed minerals

Annual deposition of riverbed minerals is dependent on various factors which are explained below.

A. Geomorphological studies

Geomorphological characteristic of a river is foremost factor for annual deposition of sedimentary load. The study includes following parameter:

i) Place of Origin

Details of origin of rivers of Sahibganj District is furnished below.

Table 7-3:- Place of Origin of important rivers and streams

Name of the River or Stream	Place of origin
Ganga River	Gangotri glacier in the Himalayas
Gumani River	Sundar Pahari

ii) Catchment Area

The Sahibganj district is mainly drained by Ganga and Gumani Rivers and their tributary rivers which are forming the catchment area of the district.

iii) General profile of river stream

River profile has been studied along the cross-section lines which was chosen based on the drastic variation of the river widths, proximity of the operating sand Ghats and the position of the sand bars.

Relative disposition of rivers in Sahibganj district along with the distribution of the section lines are shown in figure 7.1.

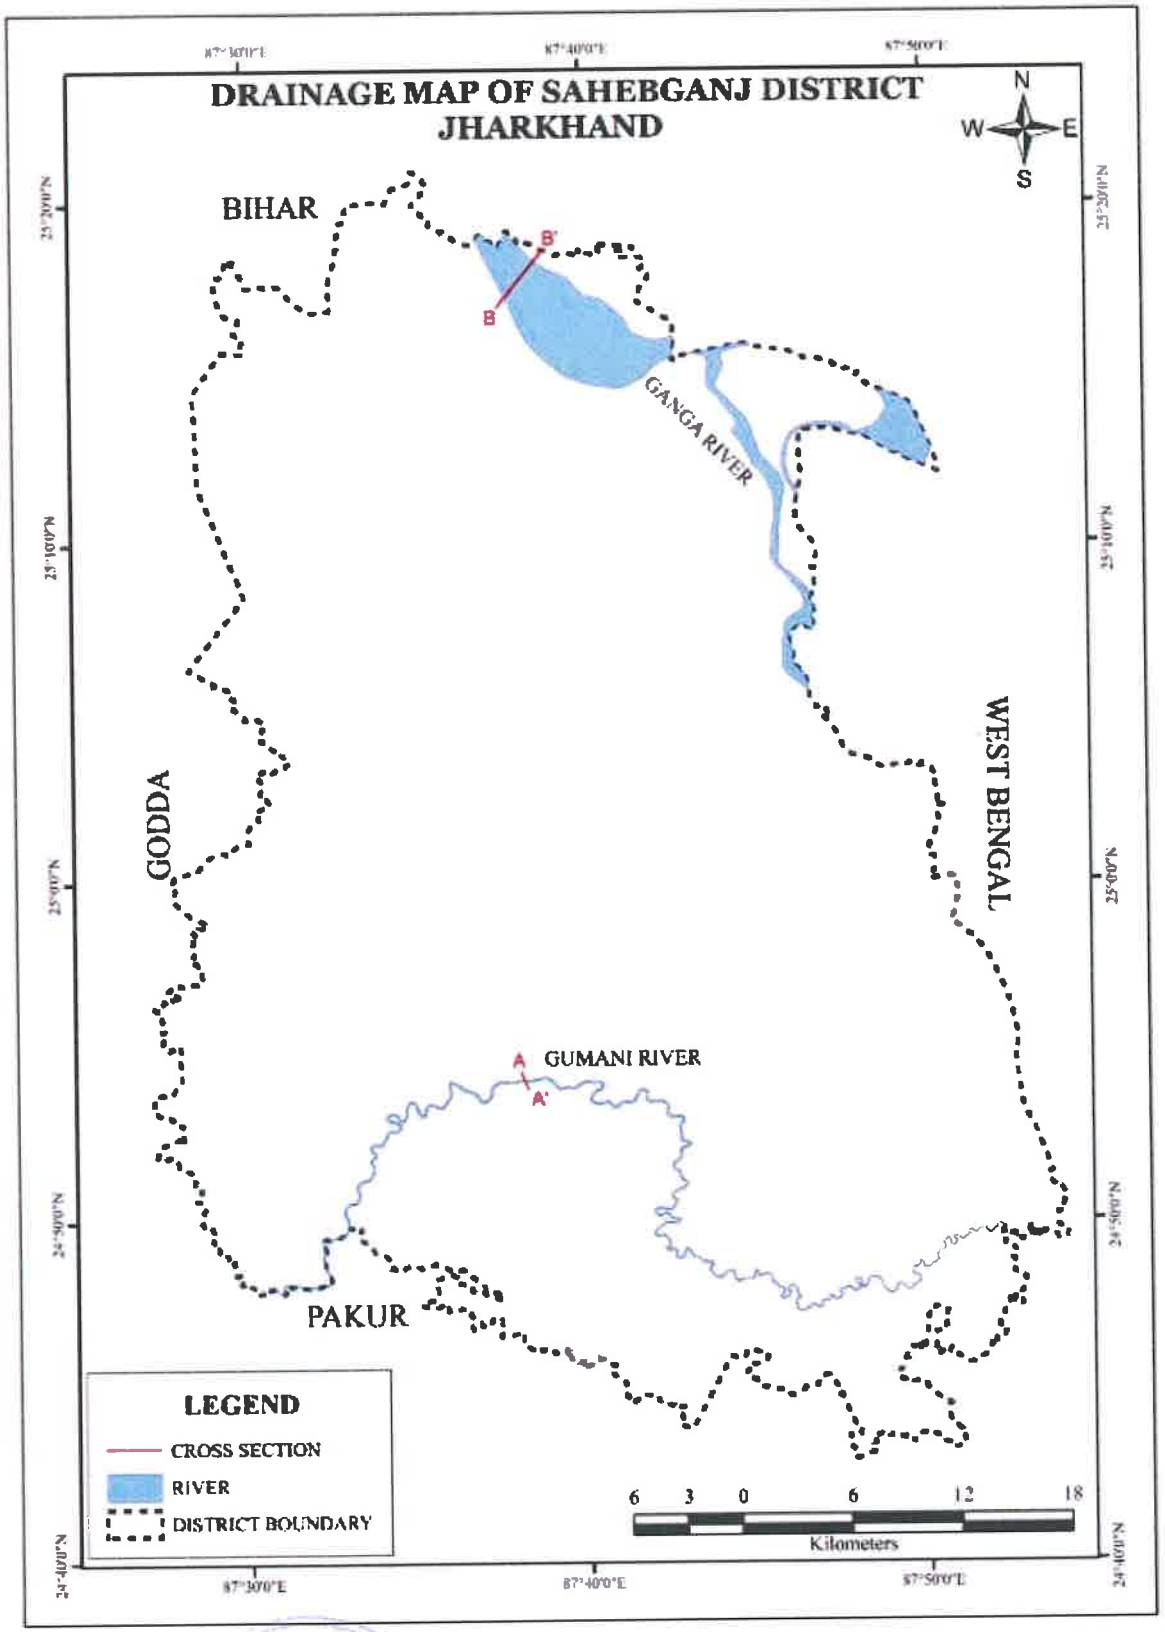

Figure 7-1:- Plan showing the major rivers along with the distribution of Section Lines, Sahibganj District, Jharkhand

Figure 7-2:- Cross Section along A-A' on river Gumani

Figure 7-3:- Cross section of Ganga River along B-B'

iv) Annual deposition factor

Annual deposition of riverbed materials depends on various factors, such as process of deposition, mode of sediment transport, sediment transport rate and sediment yield of the river.

1. Process of deposition

Deposition is the processes where material being transported by a river is deposited. Deposition occurs when the forces responsible for sediment transportation are no longer sufficient to overcome the forces of gravity and friction, creating a resistance to motion; this is known as the null-point hypothesis. This can be when a river enters a shallow area or towards its mouth where it meets another body of water.

The principle underlying the null point theory is due to the gravitational force; finer sediments remain in the water column for longer durations allowing transportation outside the surf zone to deposit under calmer conditions. The gravitational effect or settling velocity determines the location of deposition for finer sediments, whereas a grain's internal angle of friction determines the deposition of larger grains on a shore profile.

Deposition of non-cohesive sediments: Large-grain sediments transported by either bedload or suspended load. In case of bedload, when there is insufficient bed shear stress and fluid turbulence are insufficient to keep the sediment moving, the grain cease horizontal movement and rapidly come to rest. In case of suspended load the grain settle longer distance vertically through the fluid before coming to rest.

Deposition of cohesive sediments: The cohesion of sediment occurs with the small grain sizes associated with silts and clays, or particles smaller than 4Φ or 62.5 μm. If these fine particles remain dispersed in the water column, Stokes law applies to the settling velocity of the individual grains. The face of a clay platelet has a slight negative charge where the edge has a slight positive charge when two platelets come into close proximity with each other the face of one particle and the edge of the other are electrostatically attracted, and then have a higher combined mass which leads to quicker deposition through a higher fall velocity.

2. Mode of sediment transport in rivers

Sediment transport in rivers provides a dynamic linkage between flow and channel form. Mainly there are three processes by which sediment load is transported and these are (i) rolling or traction, in which the particle moves along a sedimentary bed but is too heavy to be lifted from it; (ii) saltation; and (iii) suspension, in which particles remain permanently above the bed, sustained there by the turbulent flow of the water.

Another name for sediment transport is sediment load. The total load includes all particles moving as bedload, suspended load, and wash load.

Bed load: Bedload is the portion of sediment transport that rolls, slides or bounces along the bottom of a waterway. This sediment is not truly suspended, as it sustains intermittent contact with the streambed, and the movement is neither uniform nor continuous. Bedload occurs when the force of the water flow is strong enough to overcome the weight and cohesion of the sediment. While the particles are pushed along, they typically do not move as fast as the water around them, as the flow rate is not great enough to fully suspend them. Bedload transport can occur during low flows (smaller particles) or at high flows (for larger particles). Approximately 5-20% of total sediment transport is bedload. In situations where the flow rate is strong enough, some of the smaller bedload particles can be pushed up into the water column and become suspended.

Suspended load: While there is often overlap, the suspended load and suspended sediment are not the same thing. Suspended sediment are any particles found in the water column, whether the water is flowing or not. The suspended load, on the other hand, is the amount of sediment carried downstream within the water column by the water flow. Suspended loads require moving water, as the water flow creates small upward currents (turbulence) that keep the particles above the bed. The size of the particles that can be carried as suspended load is dependent on the flow rate. Larger particles are more likely to fall through the upward currents to the bottom, unless the flow rate increases, increasing the turbulence at the streambed. In addition, suspended sediment will not necessarily remain suspended if the flow rate slows.

Wash load: The wash load is a subset of the suspended load. This load is comprised of the finest suspended sediment (typically less than 0.00195 mm in diameter). The wash load is differentiated from the suspended load because it will not settle to the bottom of a waterway during a low or no flow period. Instead, these particles remain in permanent suspension as they are small enough to bounce off water molecules and stay afloat. However, during flow periods, the wash load and suspended load are indistinguishable.

3. Sediment Transport Rate

The rate at which sediment is moved past a cross section of the flow is called either the sediment transport rate or the sediment discharge. It's related to the sediment load, but it's different, just because different fractions of the sediment load are transported at different rates. It can be measured in mass per unit time, or in weight per unit time, or in volume per unit time. The sediment transport rate is commonly denoted by Qs.

4. Estimation of Sedimentation

There are two approaches to obtaining values describing sediment loads in streams. One is based on direct measurement of the quantities of interest, and the other on relations developed between hydraulic parameters and sediment transport potential.

The total bed material load is equal to the sum of the bedload and the bed material part of the suspended load; in terms of volume transport per unit width, qt = qb + qs. Here wash load, i.e., that part of the suspended load that is too fine to be contained in measurable quantities in the river bed, is excluded from qs.

There are number of equations to compute the total sediment load. Most of these equations have some theoretical and empirical bases.

In 1973, Ackers and White developed a general theory for sediment transport which was calibrated against the flume-transport data then available. Their functions have been widely accepted as one of the best available procedures for estimating the total bed over the full width of the flow section.

Dendy Bolton formula is often used to calculate the sedimentation yield. But use of these equations to predict sediment yield for a specific location would be unwise because of the wide variability caused by local factors not considered in the equation's development. However, they may provide a quick, rough approximation of mean sediment yields on a regional basis. Computed sediment yields normally would be low for highly erosive areas and high for well stabilized drainage basins with high plant

density because the equations are derived from average values. The equations express the general relationships between sediment yield, runoff, and drainage area.

5. Sediment Yield

The water that reaches a stream and its tributaries carries sediment eroded from the entire area drained by it. The total amount of erosion debris exported from such a drainage basin is its sediment load or sediment discharge and the sediment yield is the sediment discharge divided by the total drainage area of the river upstream of the cross section at which the sediment discharge is measured or estimated. Sediment yield is generally expressed as a volume or weight per unit area of drainage basin—e.g., as tons per square kilometer. Further, sediment yield is usually measured during a period of years, and the results are thus expressed as an annual average.

v) Replenishment Study (As per EMGSM guidelines, 2020):

Replenishment study for a river solely depends on estimation of sediment load for any river system and the estimation is a time consuming and should be done over a period. The process in general is very slow and hardly measurable on season-to-season basis except otherwise the effect of flood is induced which is again a cyclic phenomenon. Usually, replenishment or sediment deposition quantities can be estimated in the following ways as given below:

A. Replenishment study based on satellite imagery involves demarcation of sand bars potential for riverbed mining. Both pre and post monsoon images need to be analysed to established potential sand bars. Volume estimation of sand is done by multiplying Depth and Area of the sand bar. The sand bars are interpreted with the help of satellite imagery. Ground truthing has been done for 100% of the total identified sand bars. During ground truthing, width and length of each segment were physically measured. It has also been observed that in few cases, sand bars have attained more than 3 meters height from the average top level of the river beds. Considerations of sand resources have been restricted within 3 meters from the average top surface of the river bed.

B. Direct field measurement of the existing leases involving estimation of the volume difference of sand during pre- and post-monsoon period. With systematic data acquisition, a model has developed for calculation of sediment yield and annual replenishment with variable components.

C. The replenishment estimation based on a theoretical empirical formula with the estimation of bed-load transport comprising of analytical models to calculate the replenishment estimation.

A. Replenishment estimation

Sedimentation in any river is dependent on sediment yield and sediment yield depends on soil erosion in river's catchment area. Catchment yield is computed using Strange's Monsoon runoff tables for runoff coefficient against rainfall return period. Peak flood discharge calculated by using Dickens, Jarvis and Rational formula at 25, 50 and 100 years return period. The estimation of bed load transport using Ackers and White Equation.

Methodology Adopted: To delineate replenishment percentage in the river bed of the district, below mentioned steps have been followed.

- **Field data collection:**

Field data collections were done during pre-monsoon period, post monsoon period & end period for the river ghats on continuous basis. However, the nonoperational areas were covered through traverses. In both the cases, relative elevation levels were captured through DGPS/ Electronic Total Station. Thickness of the sand bars was measured through sectional profiles. In few instances, sieve analysis of the sands was carried out to derive the size frequency analysis.

Physical benchmark also established using DGPS at the river site.

Figure 7-4:- Site View of River Gumani

- **Selection of Study profiles:**

Study profiles are selected based on the occurrence of the sand bars in the channel profiles. Aerial extents of each of the profiles are mapped from satellite imagery. Frequency distribution did while selection of the ground truthing of the blocks.

- **Data Compilation:**

Following data were compiled for generation of this annual replenishment report:

- Elevation levels of the different sand Ghats and Sand Bar's as measured at site.
- Extents of the sand bars are measured from the satellite imagery.
- Sand production data of the district.

- **Assessment of sediment load in the river:**

Assessment of sediment load in a river is subjective to study of the whole catchment area, weathering index of the various rock types which acts as a source of sediments in the specific river bed, rainfall data over a period not less than 20 years, and finally the detail monitoring of the river bed upliftment with time axis. Again, the sediment load estimation is not a dependent variable of the district boundary, but it largely depends upon the aerial extents of the catchment areas, which crossed the district and state boundaries.

- **Estimation of annual sand deposition:**

The major sand producing rivers of the Sahibganj district are Ganga and Gumani River. Planning has been done for systematic sand mining in the rivers.

Altogether 53 sand bars have been identified during pre-monsoon period. Out of the total 53 Ghats, 37 are falling in Gumani River, 16 ghats are falling on Ganga River.

During post-monsoon period, total 49 sand ghats identified. Out of the total 49 Ghats, 38 are falling in Gumani River, 11 ghats are falling on Ganga river.

While calculation of the areas of sand bar, a classification system has been adopted with three categories of land identified within the channel areas which is as follows:

a. The untapped Sand Bars.
b. The Sand bars worked in the pre-monsoon period.
c. Main channel course within the channel.

Details of each sand bars along with their sand resources in pre-monsoon and post monsoon period are provided in below table no 7.4.

Table 7-4:- Estimation of Sand Resources in Pre-monsoon period & Post monsoon period in sand bars

Pre monsoon						Post monsoon						Difference in Sandbar(Mcum)
S L No	Sand Bar_Code	RL (m)	Area in sq.m.	Sand Thickness in m.	Sand Volume in M. Cum	S L No	Sand Bar_Code	RL (m)	Area in sq.m.	Sand Thickness in m.	Sand Volume in M. Cum

Maps showing distribution of sand bars on rivers of the Sahibganj district during Pre and Post monsoon are depicted in Plate-A & B respectively.

Table 7-5:- Sediment Load comparison between Pre-& Post Monsoon periods for different rivers of Sahibganj district

River Name	Pre-Monsoon no of sand bar	Post-Monsoon no of sand bar	Pre-Monsoon Sediment Load (Mcum)	Post-Monsoon Sediment Load (Mcum)	Difference (Mcum)	Difference %
Gumani River	37	38	0.708	0.777	0.069	9%
Ganga River	16	11	38.958	44.032	5.074	12%
Total	**53**	**49**	**39.666**	**44.809**	**5.143**	**11%**

Thus, in Sahibganj district, about 5.143 million cum of sand has been found as an incremental volume the river of the district when compared between pre and post monsoon sand reserve data. An average aggradation and replenishment rate for the year of Sahibganj district comes to about 111%.

B. Replenishment estimation based on an empirical formula:

The river reaches with sand provide the resource and thus it is necessary to ascertain the rate of replenishment of the mineral. Regular replenishment study needs to be carried out to keep a balance between deposition and extraction. The replenishment estimation based on a theoretical empirical formula comprising of analytical models to calculate.

Sediment load deposition in a river is depend on catchment area, weathering index of the various rock types of the catchment area, land-use pattern of the area, rainfall data and grain size distribution of the sediments. Again, the sediment load estimation is not a dependent variable of the district boundary, but it largely depends upon the aerial extents of the catchment areas, which crossed the district and state boundaries.

i. Methodology of the study:

The replenishment estimation is based on a theoretical empirical formula with the estimation of bedload transport comprising of analytical models to calculate the replenishment estimation. Sedimentation in riverbed depends on catchment yield, peak flood discharge due to rainfall, bed load transport rates and sediment yield characteristic of the river. Some of the common methods used for Replenishment study are explained below.

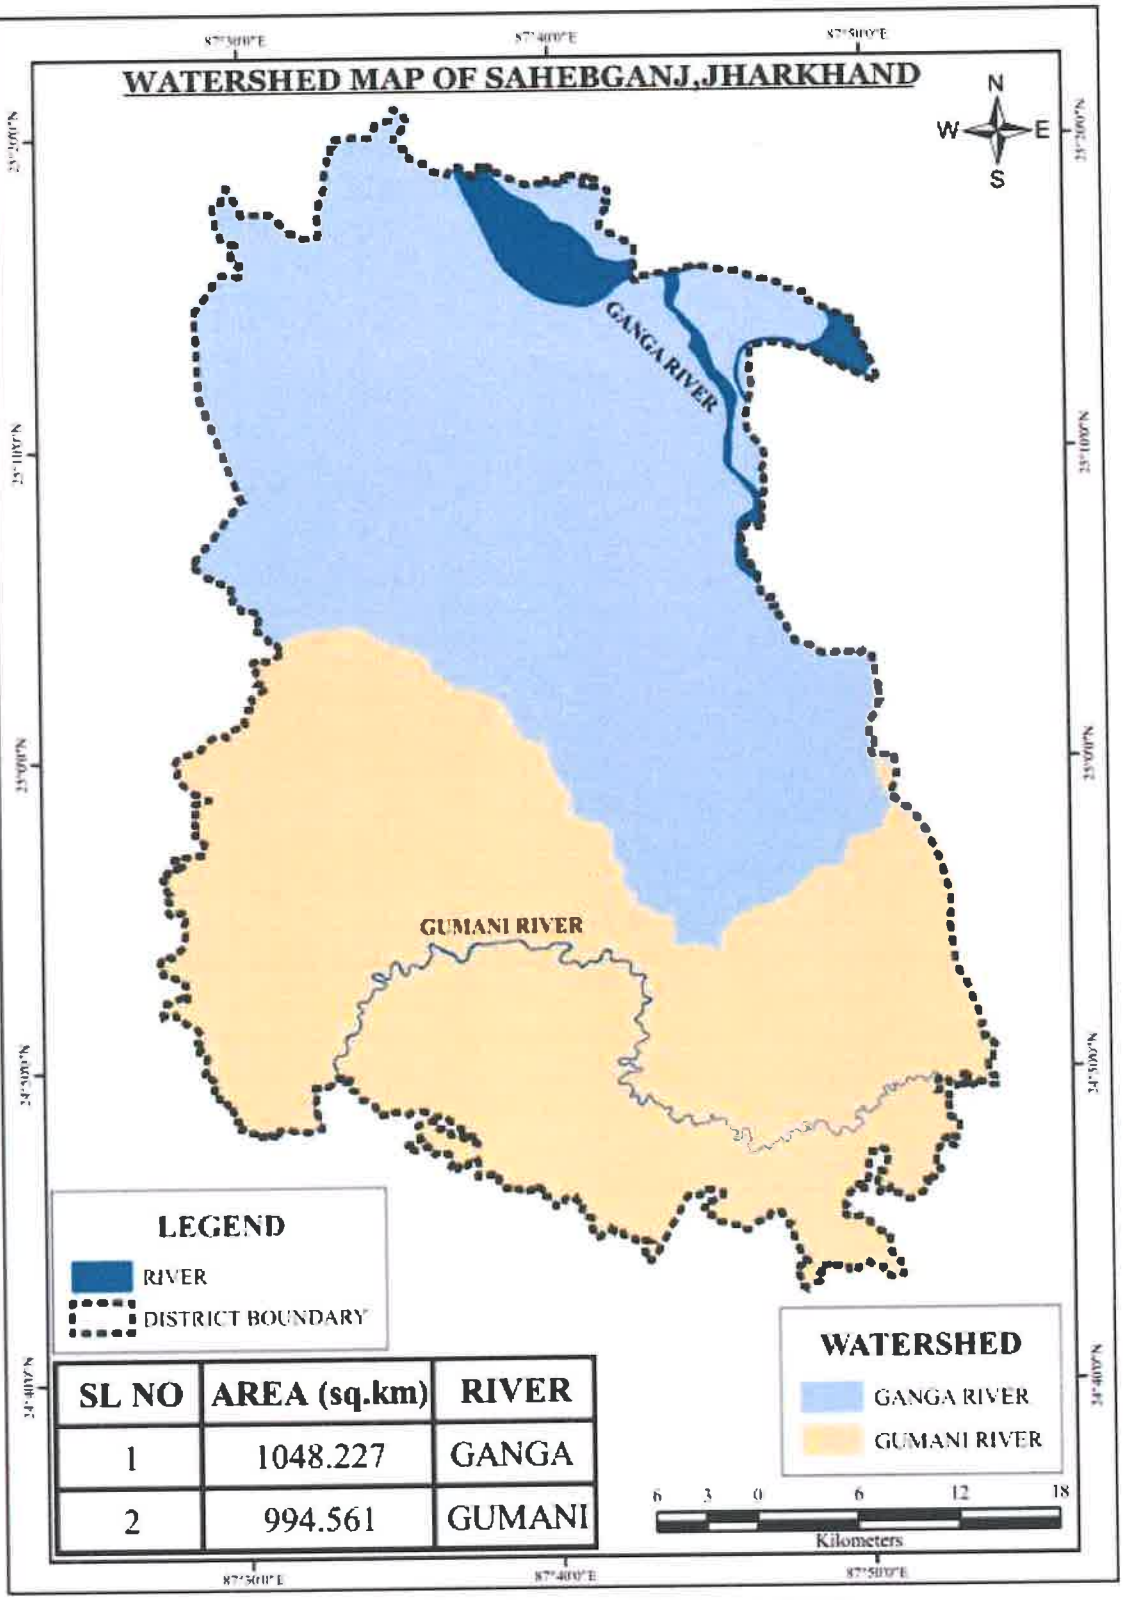
Catchment Yield Calculation:

The total quantity of surface water that can be expected in a given period from a stream at the outlet of its catchment is known as yield of the catchment in that period. The annual yield from a catchment is the end product of various processes such as precipitation, infiltration and evapo-transpiration operating on the catchment.

Catchment Yield can be estimated using following formula:

Catchment Yield (m^3) =Catchment area (m^2)* Runoff coefficient (%)*Rainfall (m)

The runoff generated from the watershed is analyzed using Strange's Tables method to get the reliable yield results. Runoff from a catchment is dependent upon annual rainfall as well as catchment characteristics such as soil types and the type of groundcover / land usage. Remote sensing was used for demarcation of catchment area relevant to the drainage system. Runoff coefficient of the catchment has been established based on Strange's Table.



SL NO	AREA (sq.km)	RIVER
1	1048.227	GANGA
2	994.561	GUMANI

Figure 7-5:- Watershed map of Sahibganj District

(Source: https://hydrosheds.org/images/inpages/HydroBASINS_TechDoc_v1c.pdf)

Strange (1892) studied the available rainfall and runoff and obtained yield ratios as functions of indicators representing catchment characteristics. Catchments are classified as good, average and bad according to the relative magnitudes of yield they give. For example, catchment with good forest cover and having soils of high permeability would be classified as bad, while catchment having soils of low permeability and having little or no vegetal cover is termed good. Based on the study Strange established runoff coefficient table as given below:

Table 7-6:- Runoff coefficient of the catchment based on Strange's Table

Total monsoon rainfall (mm)	Runoff coefficient (%)			Total monsoon rainfall (mm)	Runoff coefficient (%)		
	Good catchment	Average catchment	Bad catchment		Good catchment	Average catchment	Bad catchment
25.4	0.1	0.1	0.1	787.4	27.4	20.5	13.7

Rainfall returns period for 25, 50 and 100 years calculated as below:

As per Weibull's Formula,

Return period/Recurrence interval = (n+1)/m

Where: n number of years on record;

m is the rank of observed occurrences when arranged in descending order.

a. Peak Flood Discharge Calculation:

The term "peak discharge" stands for the highest concentration of runoff from the basin area. The accurate estimation of flood discharge remains one of the major challenges as it depends upon physical characteristic of the catchment area and the flood intensity, duration and distribution pattern. There have been many different approaches for determining the peak runoff from an area. As a result, many different models (equations) for peak discharge estimation have been developed. Formulas used for Peak Discharge calculation are as below:

As per Dicken's formula,

$$Q = CA^{3/4}$$

Where: Q is Maximum flood discharge (m^3/sec) in a river

A is Area of catchment in Sq. Km

C is Constant whose value varies widely between 2.8 to 5.6 for catchments in plains and 14 to 28 for catchments in hills

As per Jarvis formula,

$$Q = CA^{1/2}$$

Where: Q is Maximum flood discharge (m^3/sec) in a river

A is Area of catchment in Sq. Km

C is Constant whose value varies between 1.77 as minimum and 177 as maximum. Limiting or 100 percent chance floods are given by the value of C of 177

As per Rational formula,

$$Q = CIA$$

Where: Q is Maximum flood discharge (m^3/sec) in a river

A is Area of catchment in Sq. Km

C is Runoff coefficient which depends on the characteristics of the catchment area. It is a ratio of runoff: rainfall

I is Intensity of rainfall (in m/sec)

b. Bed Load Transport Calculation:

The most important problems in river engineering are to predict bed load transport rates in torrential floods flowing from mountainous streams. Three modes of transport namely; rolling, sliding and saltation may occur simultaneously in bed load transport. The different modes of transportation are

closely related and it is difficult, if not impossible, to separate them completely. There are number of equations to compute the total sediment load. Most of these equations have some theoretical and empirical bases.

Ackers and White Equation:

Ackers and White (1973) used dimensional analysis based on flow power concept and their proposed formula is as follows.

$$C_t = C_s G_s \left(d_{50}/h\right) \left(V/U_*\right)^{n'} \left[\left(F_{gr}/A_1\right) - 1\right]^m$$

The dimensionless particle d_{gr} is calculated by:

$$d_{gr} = d_{50} \left(g(G_s-1)/v^2\right)^{1/3}$$

The particle mobility factor F_{gr} is calculated by:

$$F_{gr} = (U_*^{n'}/(G_s-1) g\, d_{50})^{1/2} * (V/(5.66 \log(10h/d_{50}))^{1-n'}$$

Where,

A_1 = Critical particle mobility factor
C_s = Concentration coefficient in the sediment transport function
C_t = Total sediment concentration
d_{50} = Median grain size
d_{gr} = Dimensionless particle diameter
F_{gr} = Particle mobility parameter
g = Acceleration of gravity
D_s, S_g = Specific gravity
h = Water depth
m = Exponent in the sediment transport function
n' = Manning roughness coefficient
U_* = Shear velocity
V = Mean flow velocity
ν = Kinematic viscosity

Meyer – Peter's equation:

Meyer-Peter's equation is based on experimental work carried out at Federal Institute of Technology, Zurich. Mayer-Peter gave a dimensionless equation based, for the first time, on rational laws. Mayer- Peter equations giving an empirical correlation of bed load transport rates in flumes and natural rivers. The simplified Meyer-Peter's equation is given below:

$$g_b = 0.417[\tau_0 (\eta'/\eta)^{1.5} - \tau_c]^{1.5}$$

Where,

gb = Rate of bed load transport (by weight) in N per m width of channel per second.

η' = Manning's coefficient pertaining to grain size on an unrippled bed and Strickler formula i.e. η' = (1/24) x d1/6 where d is the median size (d_{50}) of the bed sediment in m.

η = The actual observed value of the rugosity coefficient on rippled channels. Its value is generally taken as 0.020 for discharges of more than 11cumecs, and 0.0225 for lower discharges.

τc = Critical shear stress required to move the grain in N/m2 and given by equation τc = 0.687da, where da is mean or average size of the sediment in mm. This arithmetic average size is usually found to vary between d_{50} and d_{60}.

τ0= Unit tractive force produced by flowing water i.e. γwRS. Truly speaking, its value should be taken as the unit tractive force produced by the flowing water on bed = 0.97γwRS. R is the hydraulic mean depth of the channel (depth of flow for wider channel) and S is the bed slope.

c. Sediment Yield Estimation:

Sedimentation occurred as the velocity decreases along with its ability to carry sediment. Coarse sediments deposit first, then interferes with the channel conveyance, and may cause additional river meanders and distributaries. The area of the flowing water expands, the depth decreases, the velocity is reduced, and eventually even fine sediments begin to deposit. As a result, deltas may be formed in the upper portion of reservoirs. The deposited material may later be moved to deeper portions of the reservoir by hydraulic processes within the water body.

There are many sediment transport equations which are suitable for use in the prediction of the rate of replenishment of river. Some of the famous sediment equations are:

1. Dendy – Bolton Equation
2. Yang Equations
3. Engelund-Hansen Equation
4. Modified Universal Soil Loss Equation (MUSLE) developed by Williams and Berndt (1977)

Dendy – Bolton Equation:

Dendy – Bolton formula is often used to calculate the sediment yield because:

- The formula uses catchment area and mean annual runoff as key determinants.
- It does not differentiate in basin wide smaller streams and their characteristics.
- Dendy and Bolton equation calculates all types of sediment yield i.e. Sheet and rill Erosion gully Erosion, Channel Bed and bank erosion and mass movement etc.

Dendy-Bolton determined the combined influence of runoff and drainage area on sediment yield to compute the sediment yield. They developed two equations i.e., for run off less than 2 inch and for run off more than 2 inch, which are given below:

For run off less than 2 inch:

(Q<2in) $S=1289*(Q)^{0.46}*[1.43-0.26 \text{ Log } (A)]$

For run off more than 2 inches:

(Q > 2 in): $S= 1958*(e^{-0.055*Q})*[1.43-0.26 \text{ Log } (A)]$
Where: S = Sediment yield (tons/sq miles/yr)

Q = Mean Annual runoff (inch)

A = Net drainage are in sq. mile

Dendy Bolton formula is often used to calculate the sediment yield. But use of these equations to predict sediment yield for a specific location would be unwise because of the wide variability caused by local factors not considered in the equations development. However, they may provide a quick, rough approximation of mean sediment yields on a regional basis for preliminary watershed planning. Computed sediment yields normally would be low for highly erosive areas and high for well stabilized drainage basins with high plant density because the equations are derived from average values. The equations express the general relationships between sediment yield, runoff, and drainage area. Many variables influence sediment yield from a drainage basin. They include climate, drainage area, soils, geology, topography, vegetation and land use. The effect of any of these variables may vary greatly from one geographic location to another, and the relative importance of controlling factors often varies within a given land resource area. Studies revealed that sediment yield per unit area generally decreases as drainage area increases. As drainage area increases, average land slopes usually decrease; and there is less probability of an intense rainstorm over the entire basin. Both phenomena tend to decrease sediment yield per unit area.

Modified Universal Soil Loss Equation (MUSLE):

Modified universal soil loss equation (MUSLE) for estimation of sediment yield is also used widely. MUSLE is a modification of the Universal Soil Loss Equation (USLE). USLE is an estimate of sheet and rill soil movement down a uniform slope using rain- fall energy as the erosive force acting on the soil (Wischmeier and Smith 1978). Depending on soil characteristics (texture, structure, organic matter, and permeability), some soils erode easily while others are inherently more resistant to the erosive action of rain- fall.

MUSLE is similar to USLE except for the energy component. USLE depends strictly upon rainfall as the source of erosive energy. MUSLE uses storm-based runoff volumes and runoff peak flows to simulate erosion and sediment yield (Williams 1995). The use of runoff variables rather than rainfall erosivity as the driving force enables MUSLE to estimate sediment yields for individual storm events. The generalized formula of MUSLE is as below:

Y=11.8*(Q*qP).56 *K*Ls*C*P

Where,
Y = sediment yield of stream (t/yr/km2),
Q = average annual runoff (m3),
K = soil erodibility factor,
qP = Highest discharge recorded (m3/s),
Ls = gradient/slope length,
C = cover management factor,
P = erosion control practice

ii. Estimation of Replenishment:

For replenishment study, following assumption/calculation taken in to consideration:

- Catchment area (Watershed area) against each river has been calculated based on remote sensing data.
- Rainfall runoff coefficient as per Strange's table for the catchment area is consider 45%, as the rainfall in the district is 1948 mm and the characteristic of the catchment of the district is average in nature.
- Peak flood discharge of the river of the district calculated based on Dicken's formula which is more applicable to north Indian and central Indian catchment. Here Dicken constant C is taken as 12 in present study as per published literature by Saha (2002).
- Bed load transport has not been computed in the regional aspect of the district, as the values are highly dependent on local factors such as particle mobility factor, roughness coefficient, Shear velocity, Mean flow velocity, Kinematic viscosity etc.

- Sedimentation yield calculated as per Dendy Bolton formula as the equations express the general relationships between sediment yield, runoff, and drainage area.
- Computed sediment yields by Dendy-Bolton formula normally would be low for highly erosive areas and high for well stabilized drainage basins with high plant density because the equations are derived from average values.

The data estimated for each river in the district are tabulated below.

Table 7-7:- Replenishment parameter estimated for each river in the district

Estimation parameter	Ganga	Gumani
Catchment Area (m^2)	1048000000	949000000
Annual Rainfall (m)	1.95	1.95
Strange Runoff coefficient (%)	45%	45%
Annual Run-off (m)	0.429	0.429
Catchment Yield (m^3)	919620000	832747500
Peak Flood Discharge (m^3/sec)	69895981.54	64882997.49
Flow depth d (m)	0.9	0.5
Channel width b (m)	1000	250
Mean velocity v (m/s)	0.1	0.002
Channel slope S_0 (m/m)	0.040	0.004
Sediment Yield (Tons/year)	7992.77	7345.55
Estimated Annual Replenishment (in million m3)	0.14968	0.13756

Year-wise sedimentation rate for last 5 years of each river has been calculated as below. Sedimentation rate of a river is dependent on the annual rainfall of the district.

Table 7-8:- Year-wise sedimentation rate (tons/km^2/yr) for last 5 years of each river

Year	Ganga	Gumani	Annual Rainfall
2017	14.7	12.92	1645
2018	30.16	27.61	1313.2
2019	3.08	2.06	2376.5
2020	14.17	11.38	1662.7
2021	7.63	6.74	1948.5

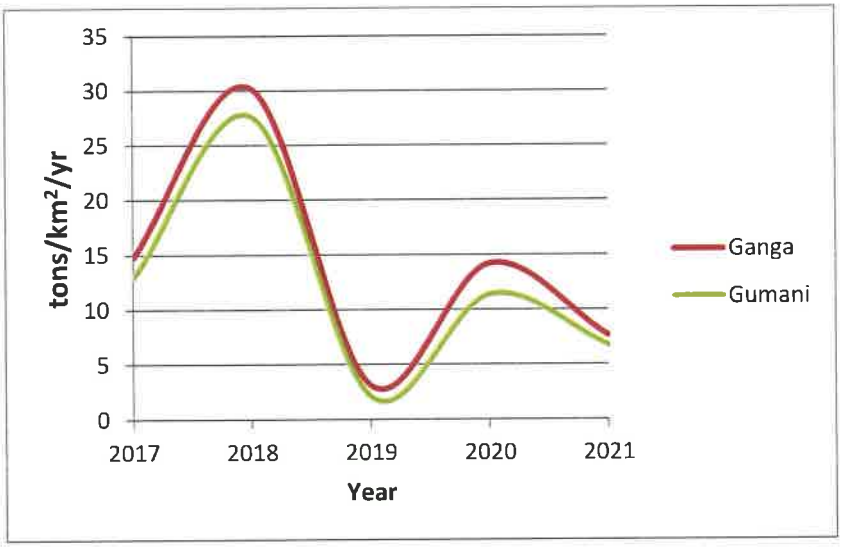

Figure 7-6:- Graphical representation of year-wise sedimentation rate

vi) Total potential of minor mineral in the river bed

The major sand producing rivers of the district are Ganga and Gumani. Total potential sand resource of the district is 40.81 Mcum. *(Source: Table no 7-10).*

B. Geological studies

i) Lithology of the catchment area

Geologically major part of the area is represented by Rajmahal traps having huge thickness of basaltic lava flows with intercalated shales and Clays. The type area is the Rajmahal hills at the head of the Ganges delta near the border of Jharkhand and west Bengal. The Rajmahal ranges extend with a north-south trend for more than 120 kms through the districts of Santhal Parganas in Jharkhand and Birnbaum in West Bengal (GSI, 1989). It consists of long flat topped hills attaining a maximum altitude of about 600 m. The basaltic lava flows of the Rajmahal Trap of middle Jurassic to lower cretaceous age occupy the major part of the district. It has been found that there are at least seven successive flows of basalt in the area, each flow ranging in thickness between 20m and 75 m. Rajmahal Traps are undererlain by Gonwana formations. Rajmahal Traps are overlain by Laterites and Alluvium. The river Ganga deposit recent alluvium occurs in the northern to eastern boundary of the area. The alluvium comprising of sand, silt, gravel and sub – ordinate clay. Laterites are mainly in situ origin and have been formed by sub – aerial erosion of underlying basalt under favorable climatic conditions.

ii) Tectonics and structural behavior of rocks

Rajmahal Traps which are dipping 2–5° towards the north-east. Individual layers vary in thickness from less than one metre (3 ft 3 in) to more than 70 metres (230 ft). These volcanic rocks were formed from the eruptions over the Kerguelen hotspot in the early Cretaceous. The similarity between the geochemical data of Rajmahal volcanos and lavas of the Kerguelen Plateau confirms this. According to plate tectonics, the Indian subcontinent was over this hot spot during the Cretaceous Period. The western boundary of the Rajmahal Traps is faulted and down-thrown towards the east. The eastern boundary of this trap has a North-South trending, fault-controlled basement.

C. Climate Factors

i) Intensity of rainfall

The average annual rainfall of the district is 1259.7mm (Between 2001 to 2020). The rainfall during the monsoon season – June to September – constitutes 80% of the annual rainfall; July, August & September are the rainiest months. The district receives a mean annual rainfall varying from 798.4mm to 1701.2mm.

ii) Climate zone

The district is characterized by humid to sub-humid climate. During summer the hot spell prevails from March to middle of June. Rainy season started from middle of June to end to September. Winter starts from the middle of November and continues till the end of February.

iii) Temperature variation

The district experiences great heat from March to May, when the maximum temperature reaches up to 44.4°c. December being the coldest month when the minimum temperatures fall down up to 6.8°c.

Annual Deposition:

Annual deposition of riverbed minerals has been calculated on post-monsoon sand volume. The pre-monsoon sand volume of the river is the depleted resources and is replenished by the monsoon rainfall.

Sand bar area recommended for mineral concession in the table is calculated as per the Enforcement and Monitoring Guidelines for Sand Mining (EMGSM) 2020. As per guidelines, mining depth restricted to 3 meters' depth and distance from the bank is ¼th of river width and not less than 7.5 meters. Also, mining is prohibited up to a distance of 1 kilometer (1 km) from major bridges and highways on both sides, or five times (5x) of the span (x) of a bridge/public civil structure (including water intake

points) on up-stream side and ten times (10x) the span of such bridge on down-stream side, subjected to a minimum of 250 meters on the upstream side and 500 meters on the downstream side.

For the purpose of estimating mineable mineral potential, the thickness of the sand bar considered extractable based on base flow level. The annual minable mineral potential is given in Table 7.10.

Table 7-9: Annual deposition of Riverbed minerals

S.No.	River or Stream	Portion of the river stream recommended for mineral concession (%)	Length of area recommended for mineral concession (in meters)	Average width of area recommended for mineral concession (in meters)	Area recommended for mineral concession (in sq. meter)	Considered mining thickness (m)	Potential Sand Resources (Mcum)	Mineable mineral potential (in million cubic meter) (60% of total mineral potential
1	GUMANI	6%	638.09	46.70	314592.24	1.5	0.5	0.28
2	GANGA	38%	7516.19	1230.13	20166981.07	2.0	40.3	24.20
Total Mineable volume							**40.81**	**24.48**

iii) Riverbed Mineral Potential

Huge quantities of quality sands are found to occur in part of rivers. Smaller patches are also available locally in the other smaller rivers as well.

Table 7-10:- Resources of Potential Riverbed Mineral

Boulder (Mcum)	Pebbles/Gravel (Mcum)	Sand/White sand (Mcum)	Total Mineable, Mineral Potential (Mcum)
-	-	24.48	24.48

NO MINING ZONE:

As per the Enforcement & Monitoring Guidelines for Sand Mining (EMGSM) 2020 the restricted zone for mining is a distance from the bank is ¼th of river width and not be less than 7.5 meters. Also, there is a no mining zone up to a distance of 1 kilometre (1 km) from major bridges and highways on both sides, or five times (5x) of the span (x) of a bridge/public civil structure (including water intake points) on up-stream side and ten times (10x) the span of such bridge on down-stream side, subjected

to a minimum of 250 meters on the upstream side and 500 meters on the downstream side.

No mining zone has been marked for an area up to a width of 100 meters from the active edge of embankments. Also, the concave side of the river is marked as no mining zone, as mining is this area will affect the course of river in future and will erode the river bank. A representative map of no mining zone shown on River Ganga & Gumani of Sahibganj district is given in Figure 7.7.

8 Overview of mining activity in the district:

8.1 General overview:

Sand is the basic raw material for its utilization in any development activity throughout the world. Sand is primarily produced from mining operations on the surface of the earth, near the river beds and the sand quarrying below the surface of earth. In the earlier time the mud houses/buildings were constructed with the use of mud. However, with the passage of time, new technique of development activities was started. As such the demand of Minor Mineral started on an increasing trend. In order to meet the requirement of raw material for construction, the extraction of sand carried out manually / semi-mechanized process from the river beds. The production of aggregate area is a function of the availability of natural resources, the size of population, the economy of the area and various developmental and infrastructural works being undertaken in the area like road construction, hydroelectric projects etc. Further, being a low- value, high-volume mineral commodity, the prices are dramatically affected by transportation distances. If the distance increases, the transportation cost may increase much more than the cost of the aggregates.

8.2 List of existing mining leases of the districts

	2019-2020	2020-2021	2021-2022
Sand	Nil	Nil	Nil
Bajri	Nil	Nil	Nil

(Source: District Mining Office, Sahibganj)

10 Transport (Railway, road)

The district has good network of roadways. The river Ganges provides water link also for such purposes. No important place in the district is left unconnected by a metalled road. The Jamtara-Dumka-Sahibganj road provides a link with Assam after ferry across the Ganges. The road between Farakka and Bhagalpur is National Highway.

In sahibganj district there are five types of major roads including NH and SH. 4 Roads are SH and One Road is NH. The National Highway (NH80) crossing from Barharwa to Mirzachowki via sahibganj town and State Highway are ADB SH-18 from Sahibganj town to Barhet Border, MDR-210 from Borio to Tinpahar rajmahal, MDR-217 from Mangalhat to Taljhari and MDR-211 Barhet to Barharwa.

Sahibganj Junction railway station is an important railway junction station on Sahibganj loop line under the Malda railway division of Eastern Railway zone.

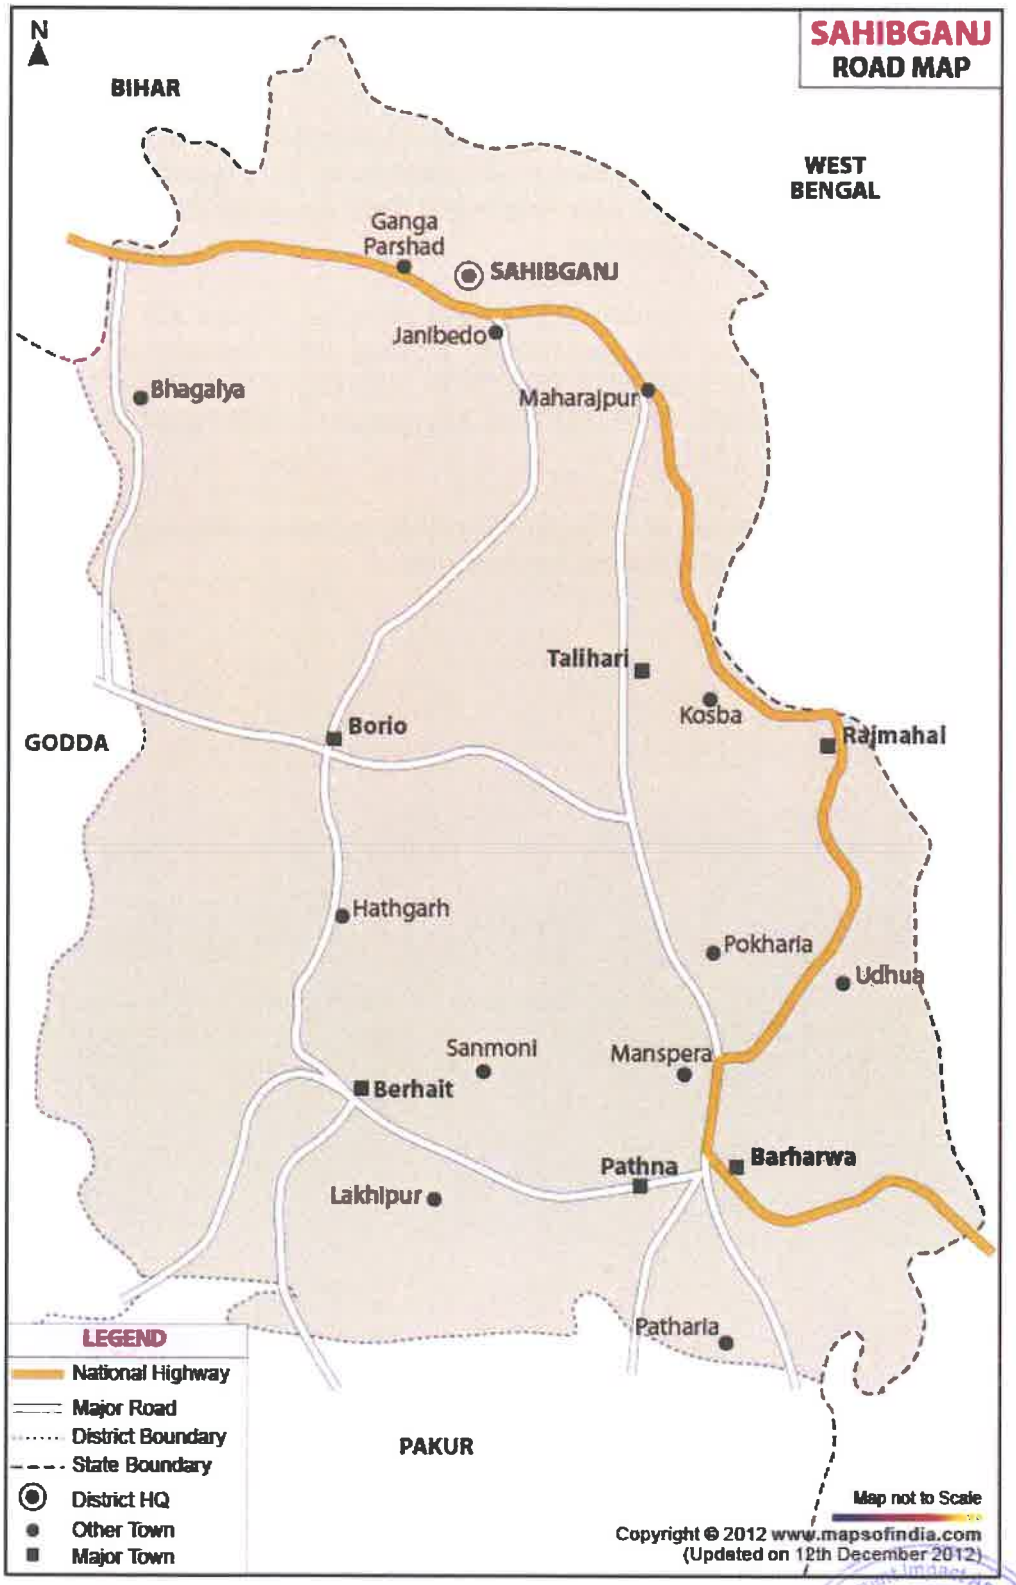

Figure 10-1 : Road map of Sahibganj District
(Source: https://www.mapsofindia.com/maps/jharkhand/districts/sahibganj.htm)

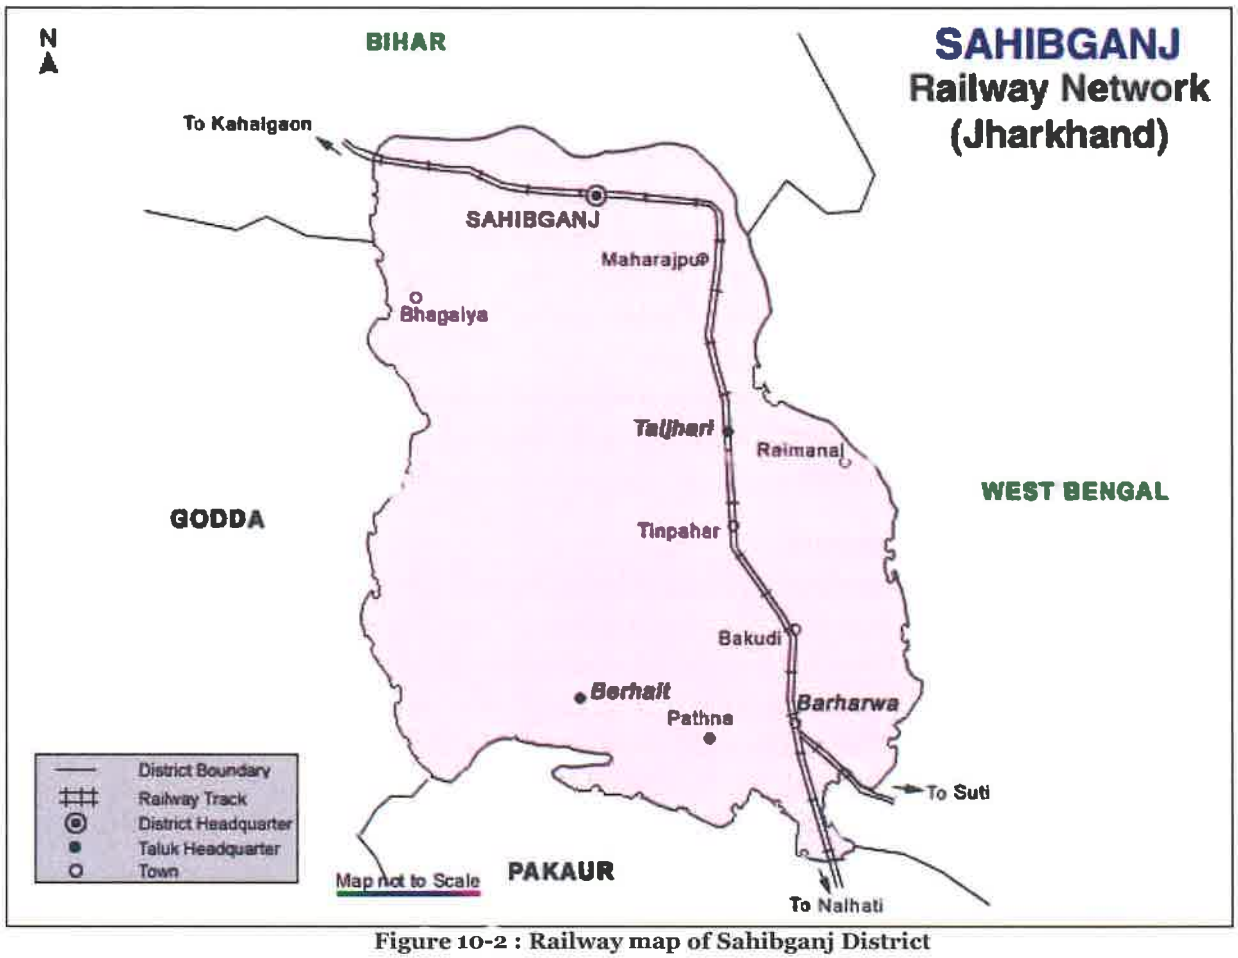

Figure 10-2 : Railway map of Sahibganj District

(Source: http://railmapindia.blogspot.com/2012/01/sahibganj-railways-map.html)

11 Environmental Sensitivity

The Sahibganj area represents a unique geo- environmental setup. As human population expands, forests are being depleted for the extension of agricultural lands, introduction of new settlements, roadways etc. The growing changes is coming in the wake of urbanization and industrialization leave deep impression on ecosystem.

Due to unprecedented growth of population during the last few, nature has started reacting sharply to the accumulated human guilt. Soil erosion and its conservation play an important role.

The adverse effect of unscientific mining is realized in the form of landslide, removal of soil cover, siltation of river beds leading to frequent floods, endangering the lives and properties of local inhabitants.

11.1 Sand mining Impact

Another serious environmental problem around the globe in recent years is of Sand mining. Sand mining is a process of extraction of sand from an open pit, river bed, sea beaches, ocean floor, river banks, deltas and island dunes. The extracted sand could be utilized for various types of manufacturing, such as concrete used in the construction of building and other structures. The sand can also be used as an abrasive. The demand for sand increase as population grows also urbanization with time. The high level of demands has offer led to the use of unsustainable sand mining process for speedy urbanization resulted in illegal mining.

Although most jurisdictions have legal limit on the location and volume of sand that can be mined, illegal sand extraction is taking place in many parts of the country due to rapid urbanization and industrialization.

Removal or extraction of too much sand from rivers leads to erosion of river banks. Deltas can recede due to sand mining. These destructive effects of sand mining ultimately result in loss of fertile land and property. It also destabilizes the ground and causes failure of engineering structures.

In-stream mining directly alters the channel geometry and bed elevation. By removing sediment from the channel, disrupts the preexisting balance between sediment supply and transporting capacity, typically inducing incision upstream and downstream of the extraction site. The resultant incision alters the frequency of floodplain inundation along the river courses, lowers valley floor water tables and frequently leads to destruction of bridges and channelization structures.

Sand Mining in beaches disturbs the ecosystem of different fauna of the beaches. The sand mining from natural barriers, made up of sand, causes flooding of the natural habitat. The sand mining activity destroys the aesthetic beauty of beaches and river bank and makes

the ecosystem unstable. If there are popular tourist destination, tourism potential of such areas will lose.

It could be concluding that there has been little in-depth research in to the environmental and social also political effect of land use practice and calls for urgent redressed by the competent authority.

11.2 Remedial measure

11.2.1 Sustainable Mining Practices:

- The depth of mining in riverbed shall not exceed 3 meter or base flow level whichever is less, provided that where the Joint Inspection Committee certifies about excessive deposit or over accumulation of mineral in certain reaches requiring channelization, it can go above 3 meters.
- Mining shall be done in layers of 1-meter depth to avoid ponding effect and after first layer is excavated, the process will be repeated for the next layers.
- No stream should be diverted for the purpose of sand mining. No natural water course and/ or water resources are obstructed due to mining operations.
- No blasting shall be resorted to in river mining and without permission at any other place.

11.2.2 Monitoring the Mining of Mineral and its Transportation:

- For each mining lease site, the access should be controlled in a way that vehicles carrying mineral from that area are tracked and accounted for.
- There should be regular monitoring of the mining activities in the State to ensure effective compliance of stipulated EC conditions and of the provisions under the Minor Mineral Concessions Rules framed by the State Government.

11.2.3 Noise Management:

- Noise arising out of mining and processing shall be abated and controlled at source to keep within permissible limit.
- Restricted sand mining operation has to be carried out between 6 am to 7 pm.

11.2.4 Air Pollution and Dust Management:

- The pollution due to transportation load on the environment will be effectively controlled and water sprinkling will also be done regularly.

- Air pollution due to dust, exhaust emission or fumes during mining and processing phase should be controlled and kept in permissible limits specified under environmental laws.
- The mineral transportation shall be carried out through covered trucks only and the vehicles carrying the mineral shall not be overloaded. Wheel washing facility should be installed and used.

11.2.5 Bio-Diversity Protection:

- Restoration of flora affected by mining should be done immediately. Five times the number of trees destroyed by mining to be planted preferably of indigenous species. Each EC holder shall have to undertake plantation of trees over at least 20% of the total area of lease in the same plot or plots utilized for such working.
- No mining lease shall be granted in the forest area without forest clearance in accordance with the provisions of the Forest Conservation Act, 1980 and the rules made there under.
- Protection of natural home of any wild animal shall have to be ensured.
- No felling of tree near quarry is allowed. For mining lease within 10km of the National Park / Sanctuary or in Eco-Sensitive Zone of the Protected Area, recommendation of Standing Committee of National Board of Wild Life (NBWL) has to be obtained as per the Hon'ble Supreme Court order in I.A. No. 460 of 2004.
- Spring sources should not be affected due to mining activities. Necessary protection measures are to be incorporated.

11.2.6 Management of Instability and Erosion:

- Removal, stacking and utilization of top soil should be ensured during mining. Where top soil cannot be used concurrently, it shall be stored separately for future use keeping in view that the bacterial organism should not die and should be spread nearby area.
- The EC should stipulate conditions for adequate steps to check soil erosion and control debris flow etc. by constructing engineering structures
- Use of oversize material to control erosion and movement of sediments
- No overhangs shall be allowed to be formed due to mining and mining shall not be allowed in area where subsidence of rocks is likely to occur due to steep angle of slope.
- No extraction of stone / boulder / sand in landslide prone areas.
- Controlled clearance of riparian vegetation to be undertaken.

11.2.7 Waste Management:

- Site clearance and tidiness is very much needed to have less visual impact of mining.
- Dumping of waste shall be done in earmarked places as approved in Mining Plan.
- Rubbish burial shall not be done in the rivers.

11.2.8 Pollution Prevention:

- Take all possible precautions for the protection of environment and control of pollution.
- Effluent discharge should be kept to the minimum and it should meet the standards prescribed.

11.2.9 Protection of Infrastructure:

- Mining activities shall not be done for mine lease where mining can cause danger to site of flood protection works, places of cultural, religious, historical, and archeological importance.
- For carrying out mining in proximity to any bridge or embankment, appropriate safety zone should be worked out on case-to-case basis, taking into account the structural parameters, location aspects and flow rate, and no mining should be carried out in the safety zone so worked out.

11.3 Suggested reclamation plan for already mined out areas

As per statute all mines/quarries are to be properly reclaimed before final closure of the mine. Reclamation plans should include:

a) A baseline survey of river cross section. The study of cross section is basis for delineating channel form. Cross-sections must be surveyed between two monumented endpoints set on the river banks, and elevations should be referenced based on benchmark set in the area;

b) The proposed mining cross-section data should be plotted over the baseline data to illustrate the vertical extent of the proposed excavation;

c) The cross-section of the replenished bar should be the same as the baseline data. This illustrates that the bar elevation after the bar is replenished will be the same as the bar before extraction;

d) A planimetric map showing the aerial extent of the excavation and extent of the riparian buffers;

e) A planting plan developed by a plant ecologist familiar with the flora of the river for any areas such as roads that need to be restored;

f) Each EC holder shall have to undertake plantation of trees over at least 20% of the total area of the plot or plots of land as subject to such working in accordance with a plan approved by the concerned Divisional Forest Officer holding jurisdiction, provided further the competent authority i.e., The Divisional Forest Officer may fix up norms for plantation of trees in a particular area regarding choice of species, spacing, nos. of trees and maintenance etc.;

g) A monitoring plan has been established.

12 Risk assessment and disaster management plan

Risk analysis is the systematic study of risks encountered during various stages of mining operation. Risk analysis seek to identify the risks involved in mining operations, to understand how and when they arise, and estimate the impact (financial or otherwise) of adverse outcomes. The sand mining operation in the district is mainly done manually.

12.1 Identification of risk due to river sand mining

There is no land degradation due to mining activities as mining is done only on river bed dry surface. There will be no OB or waste generation as the sand is exposed in the river bed and is completely saleable. There will be neither any stacking of soil nor creation of OB dumps. The mining activity will carry out up to a maximum depth of 3m below the surface level. So, there is no chance of slope failure, bench failure in the mines. However, there are some identified risk in the mining activity which are as below:

1. Accident during sand loading and transportation
2. Inundation/ Flooding
3. Quick Sand Condition

12.2 Mitigation measures

12.2.1 Measures to prevent accidents during loading and transportation:

- During the loading truck should be brought to a lower level so that the loading operation suits to the ergonomic condition of the workers.
- The workers will be provided with gloves and safety shoes during loading.
- Opening of the side covers of the truck should be done carefully and with warning to prevent injury to the loaders.
- Mining operations will be takes place during daylight only.
- The truck will be covered with tarpaulin and maintained to prevent any spillage.
- To avoid danger while reversing the trackless vehicles especially at the embankment and tipping points, all areas for reversing of lorries should be made man free as far as possible.
- All transportation within the main working will be carried out directly under the supervision and control of the management.
- Overloading should not be permitted and the maximum permissible speed limit should be ensured.
- There will be regular maintenance of the trucks and the drivers will have valid driving license.

12.2.2 Measures to prevent incidents during Inundation/ Flooding:

To minimize the risk of flooding/ inundation following measures will be under taken:

- Mining will be completely closed during the monsoon months.
- Proper weather information particularly on rain should be kept during the operational period of mines so that precautionary measures will be undertaken.

12.2.3 Measures for mitigation to quick sand condition:

- Quick sand zone and deep-water zone will be clearly demarcated and all the mines' workers will have made aware of the location.
- Mining will be done strictly as per the approved mining plan.

12.3 Disaster management plan

As the depth of mining will be maximum of 3m below the surface level considering local condition, the risk related to mining activity is much less. The mining operation will be carried out under the supervision experienced and qualified Mines Manager having Certificate of Competency to manage the mines granted by DGMS. All the provisions of Mines Act 1952, MMR 1961 and Mines Rules 1955 and other laws applicable to mine will strictly be complied. During heavy rainfall and during the monsoon season the mining activities will be closed. Proper coordination with Irrigation Department should be maintained so that at the time of releasing water, if any, from the dam suitable warning/information is given in advance. Special attention and requisite precautions shall be taken while working in areas of geological weakness like existence of slip, fault etc. The mining site will be supplied with first-aid facilities and the entire mines worker will have access to that.

13 Conclusion & Recommendation

I. The replenishment study has been carried out during the preparation of this DSR after analyzing datasets of consecutive calendar years.

II. Both field-based surveys coupled with satellite imagery study and empirical study was carried out to determine the rate of replenishment in each river of the district.

III. The determined values of various methods as adopted for replenishment study gives a comparable value and in all cases the values are found to be much more as compared to the capping limit (60%) as suggested in the Enforcement & Monitoring Guidelines for Sand Mining (EMGSM) January 2020, Issued by Ministry of Environment, Forest and Climate Change (MoEF & CC) 2020.

IV. It is suggested to have a periodical review along with field data acquisition during pre and post monsoon periods to record the seasonal variance of the sedimentation rate on annual basis and update this DSR in case of any abnormal findings.

ANNEXURE- 1

(Compliance Report)

Minutes of the 99th meeting of State Level Expert Appraisal Committee (SEAC), Jharkhand held on 7th,08th,09th, 10th and 11th December, 2022.

Sl. No	Observation by SEAC	Reply
1.	The DSR submitted was at a draft stage. The final DSR after approval by Sub divisional Committee, Deputy Commissioner and incorporation of the public comments is to be submitted for appraisal by SEAC.	This is the Final DSR after approval by Sub Divisional Committee, Deputy Commissioner and the comments of the publics are also incorporated in the DSR.
2.	The final DSR should be signed by all members of the Sub divisional Committee and the Consultants involved in the preparation of the same. All pages of the DSR should be signed by the authorized officer of the DC/ Sub divisional Committee.	Complied. The DSR has been signed by all the members of Sub divisional Committee and Consultant involved in the preparation of the report.
3.	The draft DSR submitted is based only on part survey. In the submitted draft DSR the complete area of the river / rivers has not been surveyed, only some selected Ghats / leases have been surveyed. The complete potential area should be demarcated before proposing the sand leases / Ghats as per EMGSM guideline 2020.	All the rivers have been surveyed and then the potential areas are identified and mentioned in the DSR. Kindly refer to table No. 7.4 which shows List of complete potential sand lease area as per EMGSM guideline 2020.
4.	The field survey of pre-monsoon period is to be included in final DSR.	The Pre-monsoon data provided by DMO is attached as annexure K
5.	The DSR should be placed in the public domain for at least 01 (One) month from the date of publication of the advertisement for obtaining comments of the public. The comments received shall be placed before the concerned Sub divisional Committee for consideration. The final DSR should be submitted to SEIAA, after incorporation of all replies of the comments received from the public.	The DSR was placed on public portal for one month the screenshot and the paper cutting is attached for reference as annexure G.
6.	Demand and supply of the river bed material through market survey needs to be carried out. In addition to this, future demand for the next five years also needs to	The demand and supply gap of the sand in the district is reflected in chapter 2-point no. 2.3 of

State Level Environment Impact Assessment Authority Approved Jharkhand, Ranchi

<table>
<tr><td></td><td>be considered to justify the number & area of the Sand Ghat to be included in the final DSR.</td><td>DSR.</td></tr>
<tr><td>7.</td><td>The sand Ghats / leases have not to be proposed on the confluence / meanders / concavieties / active channels of the river.</td><td>The confluence / meanders / concavities / active channels of the river are not proposed as these locations are environmentally sensitive.</td></tr>
<tr><td>8.</td><td>The Khata & Khasra (class / nature of land including "Jungle Jhari") of the lease area should be certified by the concerned Circle Officer (CO) and to be incorporated in the final DSR.</td><td>The Khata & Khasra (class / nature of land including "Jungle Jhari") of the lease area has been certified. Copy of CO Report is attached as annexure F.</td></tr>
<tr><td>9.</td><td>The distance sand leases / Ghats from the Forest / Wildlife Protected area / Birds Sanctuary / Wildlife Sanctuary / National Park / Eco Sensitive Zone should be verified and certified by the concerned DFO's of the respective Territorial and Wildlife division.</td><td>DFO Report, attached as annexure F.</td></tr>

ANNEXURE- H

(Annexure as prescribed in the EMGSM, 2020)

Annexure-I

Details of Sand/M-Sand Sources

a) Rivers:

River Name/M-Sand Plant	Total Stretch of River (in KM)	Type of River (Perennial or Non-Perennial)
Gumani	44	-

b) De-Siltation Location: (Lakes/Ponds/Dams etc.)

Name of Reservoir/Dams	Maintain/Controlled by State Govt./PSUetc.	Location	District	Tehsil	Village	Size (Ha)
Not Available	Not Available	Not Available	Not Available	Not Available	Not Available	Not Available

c) Patta Lands/Khatedari Land:

Owner	Sy. No	Area (Ha)	District	Tehsil	Village	Agricultural Land (Yes/No)
Not Available	Not Available	Not Available	Not Available	Not Available	Not Available	Not Available

d) M-Sand Plants:

Plant name	Owner	District	Tehsil	Village	Geo-location	Quantity (Tonnes)
Not Available	Not Available	Not Available	Not Available	Not Available	Not Available	Not Available

Note: For inclusion of M-Sand Plant/Patta Land in DSR the plant/landownersneed to submit the request to the Mining Department with complete details.Inclusion in DSR does not give them the right to operate the M-Sand Plant/Sand Mining lease.

Annexure-II

ANNEXURE-L

UNDERTAKING 9.3 as per EMGSM 2020

District Mining Office. Sahibganj.

Letter no 972 **Undertaking** Date. 26.9.23.

For Point no. 9.3 of the EMGSM guidelines, 2020 regarding monitoring of mining near inter district or inter-state boundary should be addressed in the final DSR, if applicable. With reference to the CO report, (Attached as annexure f), it is verified that none of the identified ghats in the district Sahibganj is crossing any inter-district or inter-state boundary.

26/9/23

District Mining Officer

Sahibganj

District Mining office. Sahibganj.

Letter no. 971 **To whom it may concern** Date - 26/9/23

This is to certify that all sitting criteria/ Provision of JSPCB & SEIAA, Jharkhand has been complied.

As per JSPCB notification no.- B-21, Ranchi dated 16/08/13.

Minimum Distance from	Distance (in meter)
NH	100
SH	100
Distance metal road	50
Railway line	100
River	100
Any other river	100
Habitation	200
Forest /Forest Land	400

As per 58th MOM -of- SEIAA Jharkhand

III. Revised format for PP to get the following information/certification from Circle Officer:-

क्रम सं०	निर्धारित बिन्दु	हाँ/नहीं
1.	क्या आवेदित भूमि की कोटि स्त्वे खतियान यथा रजिस्टर-II में जंगल झाड़ी के रूप में दर्ज है?	
2.	क्या 500 मीटर की दूरी के अंदर कोई मानव बसाहट (Habitation) स्थित है?	
3.	क्या 500 मीटर की दूरी के अंदर कोई जलीय निकाय (Dam/Reservoir) स्थित है?	
4.	क्या 500 मीटर की दूरी के अंदर कोई नदी (River) स्थित है?	
5.	क्या 500 मीटर की दूरी के अंदर कोई शैक्षणिक संस्थान (Educational Institute) स्थित है?	
6.	क्या 500 मीटर की दूरी के अंदर कोई चिकित्सालय (Hospital) स्थित है?	
7.	क्या 10 कि०मी० की परिधि में कोई अंतर्राज्यीय (Interstate) सीमा है?	
8.	क्या 500 मीटर की दूरी के अंदर कोई राष्ट्रीय धरोहर/पुरातत्वीय (Monuments/Archaeological) महत्व के स्थल स्थित है?	

As per 67th MOM -of- SEIAA Jharkhand

iv. Revised format for project proponent to get the following information / certification from Divisional Forest Officer concerned :-

क्रम सं०	निर्धारित बिन्दु	हाँ / नहीं
1.	2.	3.
1.	क्या परियोजना स्थल से आरक्षित वन / संरक्षित वन भूमि से दूरी 250 मी० है?	
2.	क्या परियोजना स्थल No Mining Zone अंतर्गत आता है?	
3.	क्या परियोजना स्थल से 10 किलो मीटर की दूरी के अंदर कोई नेशनल पार्क है?	
4.	क्या परियोजना स्थल से 10 किलो मीटर की दूरी के अंदर कोई अभ्यारण्य एवं जैव विविधता क्षेत्र है?	
5.	क्या परियोजना स्थल से 10 किलो मीटर की दूरी के अंदर कोई इको सेंसिटिव जोन (Eco Sensitive Zone) है?	
6.	क्या आवेदित परियोजना ESZ के अन्तर्गत प्रधोषित श्रेणी में आता है अथवा नहीं?	

District Mining Officer
Sahibganj
